

## Introduction to Database Systems CSE 444

### Lecture 19: Query Processing Overview

Magda Balazinska - CSE 444, Fall 2010

1

## Where We Are

- We are learning how a DBMS executes a query
  - How come a DBMS can execute a query so fast?
- Lectures 16-17: Data storage, indexing, physical tuning
- Lecture 18: Relational algebra
- Lecture 19: Overview of query processing steps
  - Includes a description of how queries are executed
- Lecture 20: Operator algorithms
- Lectures 21-23: Overview of query optimization

Magda Balazinska - CSE 444, Fall 2010

2

## Outline for Today

- **Steps involved in processing a query**
  - Logical query plan
  - Physical query plan
  - Query execution overview
- **Readings:** Section 15.1 of the book
  - Query processing steps
  - Query execution using the iterator model
  - An introduction to next lecture on operator algos

Magda Balazinska - CSE 444, Fall 2010

3

## Query Evaluation Steps

4

## Example Database Schema

```

Supplier(sno, sname, scity, sstate)
Part(pno, pname, psize, pcolor)
Supply(sno, pno, price)
  
```

### View: Suppliers in Seattle

```

CREATE VIEW NearbySupp AS
SELECT sno, sname
FROM Supplier
WHERE scity='Seattle' AND sstate='WA'
  
```

Magda Balazinska - CSE 444, Fall 2010

5

## Example Query

Find the names of all suppliers in Seattle  
who supply part number 2

```

SELECT sname FROM NearbySupp
WHERE sno IN ( SELECT sno
               FROM Supplies
               WHERE pno = 2 )
  
```

Magda Balazinska - CSE 444, Fall 2010

6

### Steps in Query Evaluation

- **Step 0: Admission control**
  - User connects to the db with username, password
  - User sends query in text format
- **Step 1: Query parsing**
  - Parses query into an internal format
  - Performs various checks using catalog
    - Correctness, authorization, integrity constraints
- **Step 2: Query rewrite**
  - View rewriting, flattening, etc.

Magda Balazinska - CSE 444, Fall 2010 7

### Rewritten Version of Our Query

Original query:

```
SELECT sname
FROM NearbySupp
WHERE sno IN ( SELECT sno
                FROM Supplies
                WHERE pno = 2 )
```

Rewritten query:

```
SELECT S.sname
FROM Supplier S, Supplies U
WHERE S.scity='Seattle' AND S.sstate='WA'
AND S.sno = U.sno
AND U.pno = 2;
```

Magda Balazinska - CSE 444, Fall 2010 8

### Continue with Query Evaluation

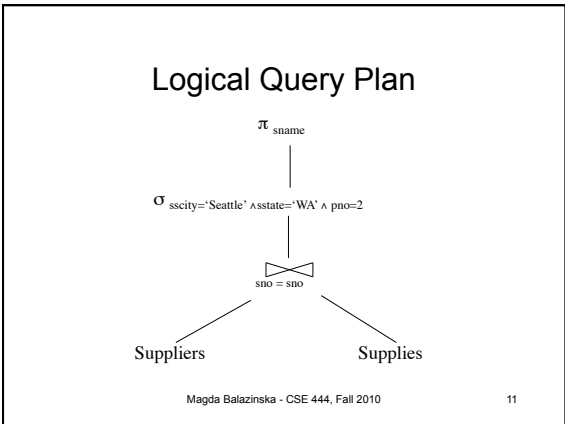

- **Step 3: Query optimization**
  - Find an efficient query plan for executing the query
  - We will spend three lectures on this topic
- **A query plan is**
  - **Logical query plan:** an extended relational algebra tree
  - **Physical query plan:** with additional annotations at each node
    - Access method to use for each relation
    - Implementation to use for each relational operator

Magda Balazinska - CSE 444, Fall 2010 9

### Extended Algebra Operators

- Union  $\cup$ , intersection  $\cap$ , difference  $-$
- Selection  $\sigma$
- Projection  $\pi$
- Join  $\bowtie$
- Duplicate elimination  $\delta$
- Grouping and aggregation  $\gamma$
- Sorting  $\tau$
- Rename  $\rho$

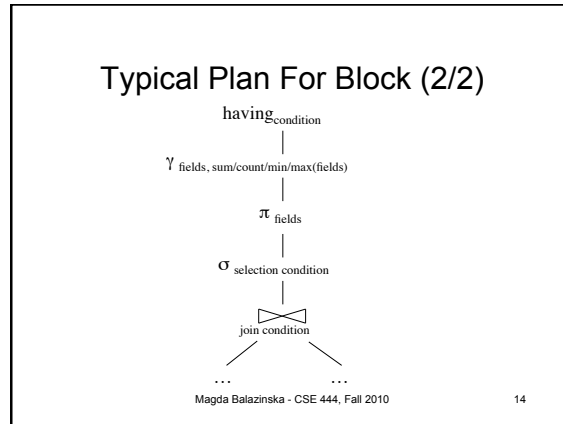

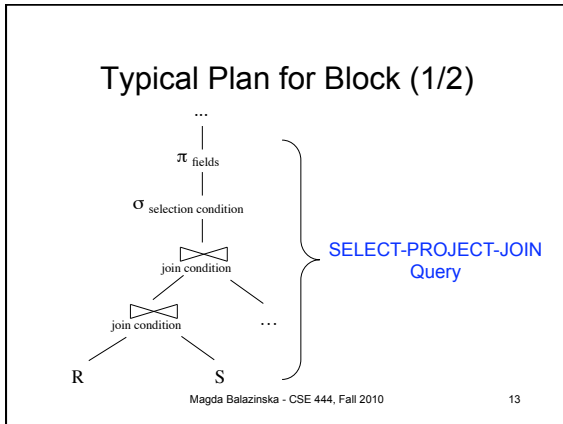

Magda Balazinska - CSE 444, Fall 2010 10

### Query Block

- **Most optimizers operate on individual query blocks**
- A query block is an SQL query with **no nesting**
  - **Exactly one**
    - SELECT clause
    - FROM clause
  - **At most one**
    - WHERE clause
    - GROUP BY clause
    - HAVING clause

Magda Balazinska - CSE 444, Fall 2010 12

### How about Subqueries?

```

SELECT Q.name
FROM Person Q
WHERE Q.age > 25
and not exists
  SELECT *
  FROM Purchase P
  WHERE P.buyer = Q.name
  and P.price > 100
        
```

Magda Balazinska - CSE 444, Fall 2010 15

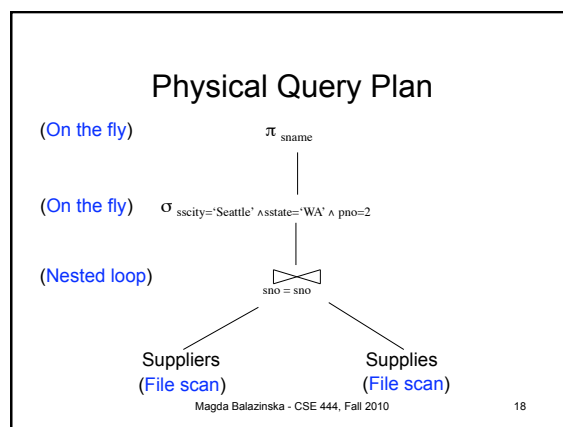

### How about Subqueries?

```

SELECT Q.name
FROM Person Q
WHERE Q.age > 25
and not exists
  SELECT *
  FROM Purchase P
  WHERE P.buyer = Q.name
  and P.price > 100
        
```

Magda Balazinska - CSE 444, Fall 2010 16

- ### Physical Query Plan
- Logical query plan with extra annotations
  - **Access path selection** for each relation
    - Use a file scan or use an index
  - **Implementation choice** for each operator
  - **Scheduling decisions** for operators
- Magda Balazinska - CSE 444, Fall 2010 17

### Final Step in Query Processing

- **Step 4: Query execution**
  - How to **synchronize operators**?
  - How to **pass data between operators**?
- Approach:
  - **Iterator interface with**
  - **Pipelined execution or**
  - **Intermediate result materialization**

Magda Balazinska - CSE 444, Fall 2010 19

### Iterator Interface

- Each **operator implements iterator interface**
- Interface has only three methods
  - **open()**
    - Initializes operator state
    - Sets parameters such as selection condition
  - **get\_next()**
    - Operator invokes get\_next() recursively on its inputs
    - Performs processing and produces an output tuple
  - **close()**: cleans-up state

Magda Balazinska - CSE 444, Fall 2010 20

### Pipelined Execution

- **Applies parent operator to tuples directly as they are produced by child operators**
- Benefits
  - No operator synchronization issues
  - Saves cost of writing intermediate data to disk
  - Saves cost of reading intermediate data from disk
  - Good resource utilizations on single processor
- This approach is used whenever possible

Magda Balazinska - CSE 444, Fall 2010 21

### Pipelined Execution

(On the fly)  $\pi_{sname}$

(On the fly)  $\sigma_{sscity='Seattle' \wedge sstate='WA' \wedge pno=2}$

(Nested loop)  $sno = sno$

Suppliers (File scan)      Suppliers (File scan)

Magda Balazinska - CSE 444, Fall 2010 22

### Intermediate Tuple Materialization

- **Writes the results of an operator to an intermediate table on disk**
- No direct benefit but
- Necessary for some operator implementations
- When operator needs to examine the same tuples multiple times

Magda Balazinska - CSE 444, Fall 2010 23

### Intermediate Tuple Materialization

(On the fly)  $\pi_{sname}$

(Sort-merge join)  $sno = sno$

(Scan: write to T1)  $\sigma_{sscity='Seattle' \wedge sstate='WA'}$       (Scan: write to T2)  $\sigma_{pno=2}$

Suppliers (File scan)      Suppliers (File scan)

Magda Balazinska - CSE 444, Fall 2010 24

## Next Time

- Algorithms for physical op. implementations
- How to find a good query plan?
