CSE 451: Operating Systems

Section 6

Project 2b

Midterm

* Scores are up on Catalyst and midterms were handed back on Wednesday in class

* Talk to Ed, Elliott or Jim about grading questions

  * Office hours are the best time for this

Project 2a learnings

* What sort of interesting behavior have you seen in experimenting with test-burgers?

* What has been the hardest part of the library to implement?

Project 2a memory

* Need a volunteer.

* Yes, that means you

Project 2b

* Parts 4, 5 and 6 of project 2

* Due at 11:59pm, Friday May 24

Part 4: web server

* web/sioux.c – singlethreaded web server
  * Read in command line args, run the web server loop

Part 4: web server

∗ web/sioux_run.c – the web server loop

  ∗ Open a socket to listen for connections (`listen(2)`)

  ∗ Wait for a connection (`accept(2)`)

  ∗ Handle connection:

    ∗ Parse the HTTP request

    ∗ Find and read the requested file

   ∗ Send the file back

    ∗ Close the connection

Thread pools

Image from http://en.wikipedia.org/wiki/Thread_pool_pattern
More info: http://www.ibm.com/developerworks/java/library/j-jtp0730.html

What you need to do

* Make the web server multithreaded
  * Create a thread pool
    * Suggestion: create separate thread_pool.h, thread_pool.c
  * Wait for a connection
  * Find an available thread to handle the request
    * Request waits (where?) if all threads busy
  * Once the request is handed to a thread, it uses the same processing code as before
  * See `web_runloop()` in sioux_run.c

Hints

* Each connection is identified by a socket file descriptor returned by `accept(2)`
  * File descriptor (fd) is just an int

* Threads should sleep while waiting for a new connection
  * Condition variables are perfect for this

Hints

* Don't forget to protect any global variables
  * Use mutexes and CVs from part 2

* Develop and test with pthreads initially

* Use only the sthread.h interface

* Mostly modify sioux_run.c, and your own files

Part 5: preemption

∗ What we give you (see `sthread_preempt.c`):

  ∗ Timer interrupts

  ∗ Function to turn interrupts on and off

  ∗ Synchronization primitives
    `atomic_test_and_set`, `atomic_clear`

    ∗ x86/amd64 architectures only

Part 5: preemption

* What you have to do:
  * Add code that will run every time a timer interrupt is generated
  * Add synchronization to your part 1 and part 2 implementations so that everything works with preemptive thread scheduling

* Can be done independently of part 4

sthread_preempt.h

```
/* Start preemption - func will be called
 * every period microseconds
 */
void sthread_preemption_init
   (sthread_ctx_start_func_t func,
    int period);

/* Turns interrupts on (LOW) or off (HIGH)
 * Returns the last state of the
 * interrupts
 */
int splx(int splval);
```

sthread_preempt.h

```
/* atomic_test_and_set - using the native
 * compare and exchange on the Intel x86.
 *
 * Example usage:
 *    lock_t lock;
 *    while(atomic_test_and_set(&lock))
 *      {} // spin
 *    _critical section_
 *    atomic_clear(&lock);
 */
int atomic_test_and_set(lock_t *l);
void atomic_clear(lock_t *l);
```

Signals

* Used to notify processes of events asynchronously

* Every process has a *signal handler* table

* When a signal is sent to a process, OS interrupts that process and calls the handler registered for that signal

Signal manipulation

* A process can:
  * Override the default signal handlers using `sigaction(2)`
  * Block / unblock signals with `sigprocmask(2)`
  * Send a signal via `kill(2)`

* Signals:
  * `SIGINT (CTRL-C), SIGQUIT (CTRL-\), SIGKILL, SIGFPE, SIGALRM, SIGSEGV…`

What you need to do

* Add a call to sthread_preemption_init() as the last line in your sthread_user_init() function

  * sthread_preemption_init() takes a pointer to a function that will be called on each timer interrupt

    * This function should cause thread scheduler to switch to a different thread!

What you need to do

* Add synchronization to *critical sections* in thread management routines
  * Think: what would happen if the code was interrupted at this point?
    * Would it resume later with no problems?
    * Could the interrupting code mess with any variables that this code is currently using?
  * Don't have to worry about simplethreads code that you didn't write (i.e. sthread_switch): already done for you

What you need to do

✳ Before doing a context switch, interrupts should be disabled to avoid preemption. How can they be reenabled after the switch?

  ✳ Hint: Think of the possible execution paths

Interrupt disabling

Non-thread-safe

```
/* returns next thread
 * on the ready queue */
sthread_t
sthread_user_next() {
  sthread_t next;
  next = sthread_dequeue

(ready_q);
  if (next == NULL)
    exit(0);
  return next;
}
```

Thread-safe

```
sthread_t
sthread_user_next() {
  sthread_t next;
  int old = splx(HIGH);
  next = sthread_dequeue
                (ready_q);
  splx(old);
  if (next == NULL)
    exit(0);
  return next;
}
```

Interrupt disabling

* Why do we call `splx(old)` after dequeuing instead of just `splx(LOW)`?

Thread-safe

```
sthread_t
sthread_user_next() {
    sthread_t next;
    int old = splx(HIGH);
    next = sthread_dequeue
                    (ready_q);
    splx(old);
    if (next == NULL)
        exit(0);
    return next;
}
```

Atomic locking

* So what is `atomic_test_and_set()` for?

  * Primarily to implement higher-level synchronization primitives (mutexes, CVs)

* One way to think about preemption-safe thread library:

  * Disable/enable interrupts in "library" context

  * Use atomic locking in "application" context

Race conditions and testing

* How can you test your preemption code?

* How can you know that you've found all of the critical sections?

Part 6: report

∗ Covers *all* parts of project 2

∗ Discuss your design decisions. In detail. PLEASE!

∗ Performance evaluation:

  ∗ Measure throughput and response time of your web server using web benchmarking tool

    ∗ Vary the number of threads and number of "clients"

  ∗ Present results in *graphical* form

  ∗ Explain results: expected or not?

Project 2 questions?
