CSE/EE 461 – Lecture 15

Retransmission and Timers

David Wetherall djw@cs.washington.edu

Last Time ...

- More on the Transport Layer
- Focus
 - How do we manage connections?
- Topics
 - Three-Way Handshake
 - Close and TIME_WAIT

Application

This Lecture

- More on the Transport Layer
- Focus
 - How do we decide when to retransmit?

Topics

- RTT estimation
- Karn/Partridge algorithm
- Jacobson/Karels algorithm

Application

L15.3

Deciding When to Retransmit

- How do you know when a packet has been lost?
 - Ultimately sender uses timers to decide when to retransmit
- But how long should the timer be?
 - Too long: inefficient (large delays, poor use of bandwidth)
 - Too short: may retransmit unnecessarily (causing extra traffic)
 - A good retransmission timer is important for good performance
- Right timer is based on the round trip time (RTT)
 - Which varies greatly in the wide area (path length and queuing)

djw // CSE/EE 461, Autumn 2001

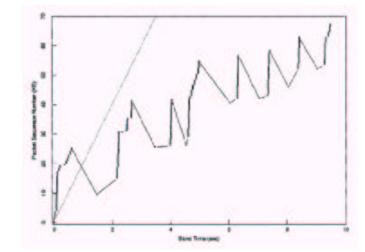

A Simple Network Model

- Buffers at routers used to absorb bursts when input rate > output
- Loss (drops) occur when sending rate is persistently > drain rate

Chapter 6, Figure 1djw // CSE/EE 461, Autumn 2001

Effects of Early Retransmissions

djw // CSE/EE 461, Autumn 2001

Congestion Collapse

- In the limit, early retransmissions lead to <u>congestion</u> <u>collapse</u>
 - Sending more packets into the network when it is overloaded exacerbates the problem of congestion
 - Network stays busy but very little useful work is being done
- This happened in real life ~1987
 - Led to Van Jacobson's TCP algorithms, which form the basis of congestion control in the Internet today

[See "Congestion Avoidance and Control", SIGCOMM'88]

L15.7

Estimating RTTs

- Idea: Adapt based on recent past measurements
- Simple algorithm:
 - For each packet, note time sent and time ack received
 - Compute RTT samples and average recent samples for timeout
 - EstimatedRTT = α x EstimatedRTT + (1α) x SampleRTT
 - This is an exponentially-weighted moving average (low pass filter) that smoothes the samples. Typically, $\alpha = 0.8$ to 0.9.
 - Set timeout to small multiple (2) of the estimate

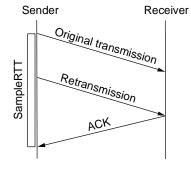

djw // CSE/EE 461, Autumn 2001

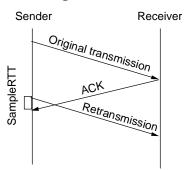

Karn/Partridge Algorithm

• Problem: RTT for retransmitted packets ambiguous

 Solution: Don't measure RTT for retransmitted packets and do not relax backed of timeout until valid RTT measurements

djw // CSE/EE 461, Autumn 2001

L15.10

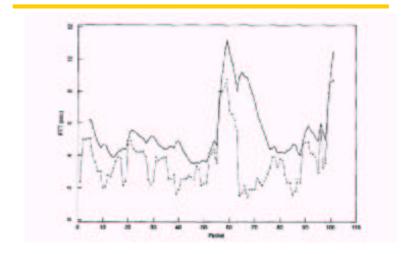

Jacobson/Karels Algorithm

- Problem:
 - Variance in RTTs gets large as network gets loaded
 - So an average RTT isn't a good predictor when we need it most
- Solution: Track variance too.
 - Difference = SampleRTT EstimatedRTT
 - EstimatedRTT = EstimatedRTT + $(\delta x \text{ Difference})$
 - Deviation = Deviation + $\delta(|Difference| Deviation)$
 - Timeout = μ x EstimatedRTT + ϕ x Deviation
 - In practice, $\delta = 1/8$, $\mu = 1$ and $\phi = 4$

L15.11

Estimate with Mean + Variance

djw // CSE/EE 461, Autumn 2001

Key Concepts

- A good retransmit timer is important for good performance
 - Too long leads to poor performance
 - Too short leads to wasted bandwidth
- An estimated timeout must adapt to Internet queuing
 - High variance at high load
