

Introduction to SimpliciTI

Low-power RF protocol from Texas Instruments

Outline

- Overview – What is SimpliciTI?
- Device types and network topologies
- SimpliciTI software architecture
- Example: How to configure SimpliciTI devices
- Insight on packet format and addressing
- Supported hardware platforms
- Demonstration: Temp sensor network

What is SimpliTI?

SimpliTI is:

- Low Power: a TI proprietary **low-power RF** network protocol
- Low Cost: uses < 8K FLASH, 1K RAM depending on configuration
- Flexible: simple **star** w/ extendor and/or **p2p** communication
- Simple: Utilizes a very **basic** core API
- Versatile: **MSP430+CC110x/2500**, CC1110/2510, CC1111/CC2511, CC2430, CC2520
- Low Power: Supports **sleeping** devices

3

Application Areas

SimpliTI supports:

- alarm & security: occupancy sensors, light sensors, carbon monoxide sensors, glass-breakage detectors
- smoke detectors
- remote controls
- AMR: gas meters, water meters, e-meters
- home automation: garage door openers, appliances, environmental devices

4

Outline

- Overview – What is SimpliciTI?
- Device types and network topologies
- SimpliciTI software architecture
- Example: How to configure SimpliciTI devices
- Insight on packet format and addressing
- Supported hardware platforms
- Demonstration: Temp sensor network

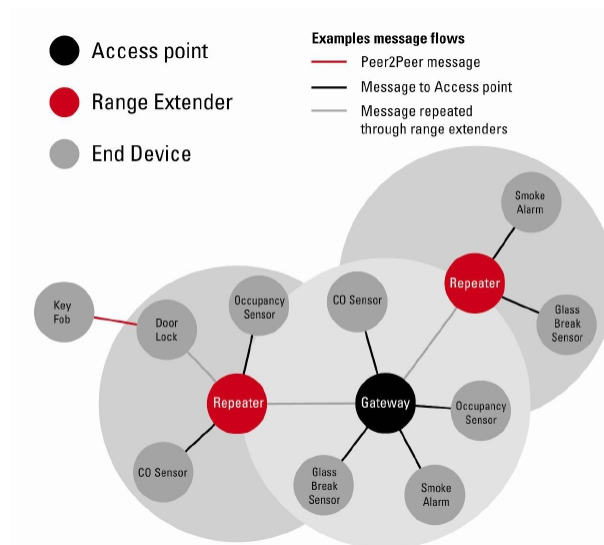

5

SimpliciTI Network topology

wireless sensing application

- Range can be extended through repeaters.

- The circles represent range of gateway and extended range of repeaters.

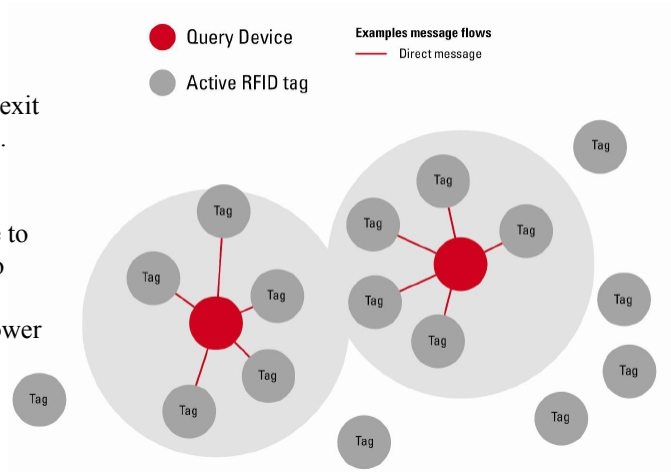

SimpliciTI Network topology

Active RF tags

- Active RF tags typically enter and exit the network ad-hoc.

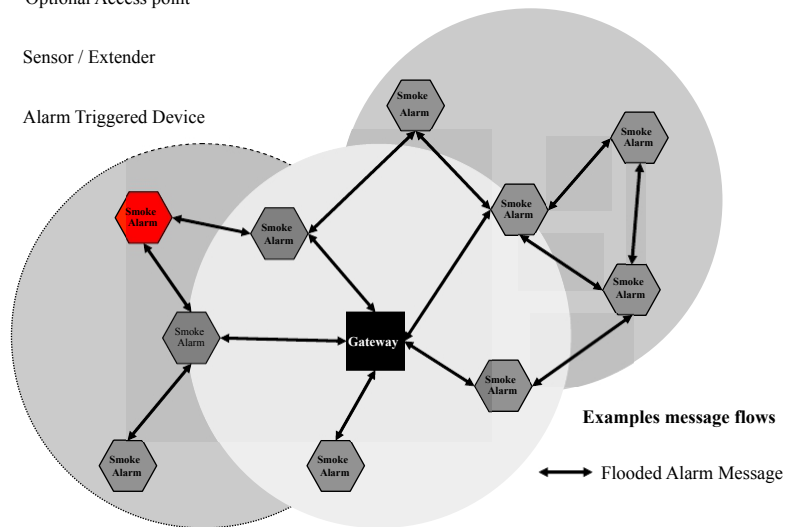

- Tags must be able to quickly associate to the network while maintaining low power consumption.

SimpliciTI Network topology

Smoke Detector System

- Optional Access point
- ⬡ Sensor / Extender
- ⬡ Alarm Triggered Device

Outline

- Overview – What is SimpliciTI?
- Device types and network topologies
- SimpliciTI software architecture
- Example: How to configure SimpliciTI devices
- Insight on packet format and addressing
- Supported hardware platforms
- Demonstration: Temp sensor network

9

Architectural Overview

- Layers
 - MRFI (“minimal RF interface”)
 - NWK
 - nwk applications (modules)
 - customer applications
- Network Support
 - init
 - ping
 - link / linklisten
 - nwk mgmt
 - send / receive
 - I/O

10

Application Programming Interface (API)

- initialization
 - `smplStatus_t SMPL_Init(uint8_t (*callback)(linkID_t));`
- linking (bi-directional by default)
 - `smplStatus_t SMPL_Link(linkID_t *linkID);`
 - `smplStatus_t SMPL_LinkListen(linkID_t *linkID);`
- peer-to-peer messaging
 - `smplStatus_t SMPL_Send(lid, *msg, len);`
 - `smplStatus_t SMPL_Receive(lid, *msg, *len);`
- configuration
 - `smplStatus_t SMPL_Ioctl(object, action, *val);`

11

Simple Configuration

- operational mode (type)
- power mode (sleep support)
- topology
- addressing / identification
- RAM allocation
 - packet size
 - buffer sizes
 - # supported links (connections)
- security tokens
- messaging (hop ct, repeaters)
- radio (freq, crypto key, modulation, CCA parameters)

```

/* FROM smpl_config.dat */
// Number of connections supported
-DNUM_CONNECTIONS=4

// Maximum size of application payload
-DMAX_APP_PAYLOAD=20

// size of low level queues for sent and received frames.
-DSIZE_INFRAME_Q=2
-DSIZE_OUTFRAME_Q=2

// default Link token
-DDEFAULT_LINK_TOKEN=0x01020304

// default Join token
-DDEFAULT_JOIN_TOKEN=0x05060708

// this device's address.
-DTHIS_DEVICE_ADDRESS="{0x79, 0x56, 0x34, 0x12}"

// device type
-DEND_DEVICE

// for End Devices specify the Rx type.
//-DRX_LISTENS
//-DRX_POLLS
//-DRX_NEVER
-DRX_ALWAYS

```

12

Runtime Configuration

- radio frequency
- encryption key
- app access to frame header
- app access to radio controls
- AP nwk mgmt control

| Object | Description | Comments |
|---------------------------|---|---|
| IOCTL_OBJ_FREQ | Get/Set radio frequency | Frequency agility. May be used by APP or NWK . |
| IOCTL_OBJ_CRYPTKEY | Set encryption key | Customer may provide external means for user to set a non-default key. Requires reset to take effect. |
| IOCTL_OBJ_RAW_IO | Application layer access to the frame header to directly send or receive a frame. | This object is used for example to ping another device where the network address of the target device is supplied directly and not done through the connection table. |
| IOCTL_OBJ_RADIO | Application layer access to some radio controls. | Limited access to radio directly. For example, sleeping and awakening the radio and getting signal strength information. |
| IOCTL_OBJ_AP_JOIN | Access Point join-allow context | Interface to control whether Access Point will allow devices to join or not. |

13

Outline

- Overview – What is SimpliciTI?
- Device types and network topologies
- SimpliciTI software architecture
- Example: How to configure SimpliciTI devices
- Insight on packet format and addressing
- Supported hardware platforms
- Demonstration: Temp sensor network

14

Example

How to configure Access Point

- star hub in the network (1 / net)
- always-on (acts as range extender)
- store and fwd for sleeping devices
- linking and token (link and join) mgmt
- AP can implement end device functionality (link listen, receive)

```
// Initialize the HW/Radio
BSP_Init(); // initialize the BSP (API subject to change)
SMPL_Init(0);

// Handle Linking
SMPL_LinkListen(&linkID1);

// Receive Messages
While (1) {
    while((SMPL_SUCCESS == SMPL_Receive(linkID1, msg, &len) {
        // do something
    }}
}}
```

15

Example

How to configure Range Extender

- always-on device
- repeats received frames (with limitations)
- limited to 4 / net (although flexible in design)

```
// Initialize the HW/Radio
BSP_Init();
SMPL_Init(0);

// No Linking or application level functionality
while(1);
```

16

Example

How to configure End Device

- poll for data
 - polling is Port specific
 - no data results in blank (empty) response
- API e.g. Sequence
 - Init (and Join)
 - Link (assumes listen)
 - Sample Temp
 - Send
- option to sleep

```

void main()
{
  linkID_t linkID;
  uint32_t temp;

  // Initialize the board's HW
  BSP_Init();
  SMPL_Init(0);
  // link.
  SMPL_Link(&linkID);

  while (TRUE)
  {
    // sleep until timer. read temp sensor
    MCU_Sleep();
    HW_ReadTempSensor(&temp);
    if (temp > TOO_HIGH)
    {
      SMPL_Send(linkID, "Hot!", 4);
    }
    if (temp < TOO_LOW)
    {
      SMPL_Send(linkID, "Cold!", 5);
    }
  }
}

```

17

Outline

- Demonstration: Temp sensor network

18

Packet Format

| PREAMBLE | SYNC | LENGTH | MISC | DSTADDR | SRCADDR | PORT | DEVICE INFO | TRACTID | App Payload | FCS |
|----------|------|--------|------|---------|---------|------|-------------|---------|-------------|-----|
| RD* | RD* | 1 | RD* | 4 | 4 | 1 | 1 | 1 | n | RD* |

| | | | | | | | | | | |
|------------------|--|--|--|--------------|--|--|--|-------------|--|--|
| Network header | | | | | | | | App payload | | |
| MRFI header | | | | MRFI payload | | | | | | |
| MRFI frame | | | | | | | | | | |
| SimpliciTI frame | | | | | | | | | | |

*RD: Radio-dependent populated by MRFI or handled by the radio itself

- preamble: hw sync
- sync: hw sync
- length: bytes non-phy
- dstaddr
- srcaddr
- port: app port number
- dev info: capabilities
- tractid: transaction nonce or seq num
- app pyld: $0 \leq n \leq 52$ byte/113 byte (radio dependent)
- crc: must be valid

19

Addressing and Communication

- net address = hw addr (4 byte) + app port
 - statically assigned hw addr
 - no address resolution mechanism
- byte 1: 0x00, 0xFF – reserved for broadcast
- communication topologies:

Logical path - - - - -
 Data path —————
 NWK management
 management

• direct peer-2-peer

• direct p2p through RE

• store and fwd p2p through AP

• store and fwd p2p through RE and AP

20

Additional Details

- CCS development environment
- minimal hw abstraction
- no driver support (UART, SPI, LCD, Timers)
- no heap utilization
- no runtime (nwk) context storage
- single thread (app), no tasks or scheduling
- nwk api is synchronous (does not return until operation is complete)
- retries and acks must be managed by app

22

Hardware Support

- MSP-EXP430FG4618 Experimenters Board
 - (MSP430FG4618) w/ Socket Interface for CC110x / CC2500
- eZ430RF-2500
 - MSP430F2274 + CC2500
- CC2510-CC2511DK and CC1110 CC1111DK
- DSSS (MSP430 + CC2420, CC2430)
- CC2520

23

Outline

- Overview – What is SimplexTI?
- Device types and network topologies
- SimplexTI software architecture

- Supported hardware platforms
- Demonstration: Temp sensor network

24

Current Consumption

How to estimate and measure?

- Guideline to SimpliciTI current consumption as presented in application note:
- Wireless Sensor Monitor Using the eZ430-RF2500.
- <http://www.ti.com/litv/pdf/slaa378a>

27

Available examples

| Where | What | Notes |
|------------------------------|--|---|
| SimpliciTI distribution | SimpliciTI examples: <ul style="list-style-type: none"> - 2 ED with bi-di - AP as data hub - Cascading ED - Simple polling with AP | |
| eZ430-RF2500 | - Temp.Sens network with PC gui | <ul style="list-style-type: none"> - Distributed with eZ430-RF2500. - Comes with app.note |
