

Critical Sections: Motivating Example			
Thread 0	Thread 1	Acct Time	
	blt r4,r2,label	500 ne	
	<pre>sub r4,r2,r4 st r4,0(r1) call give_cash</pre>	400	
		Ļ	
Spring 2015	CSE 471: Synchronization	2	

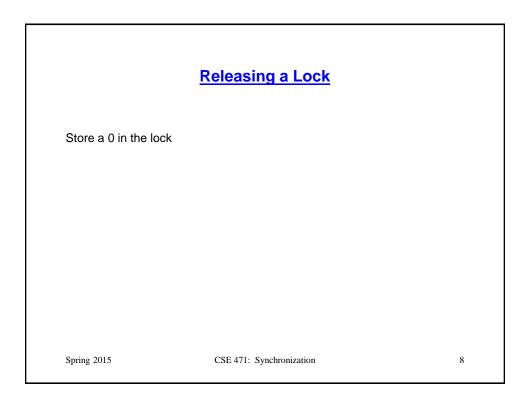

Critical Sections			
• to	 section sequence of code that only one thread can execute at a time execute a critical section, a thread acquires a lock that guards it executes its code releases the lock rovides mutual exclusion threads have exclusive access to the code & the data that it accesses guarantees that only one thread can update shared data at a time 		
The effec data	t is to synchronize threads with respect to their accessing share	ed	
Spring 2015	CSE 471: Synchronization	3	

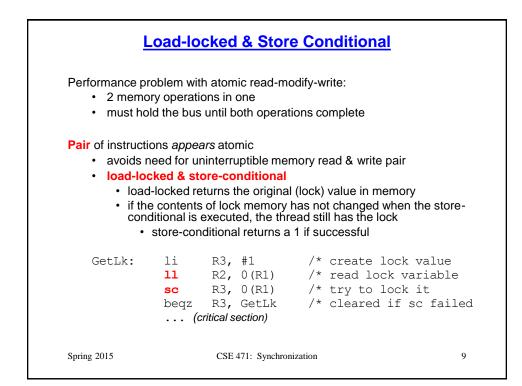

Critical Sections: Correct Example			
<u>Thread 0</u>	Thread 1	Mem Time	
<pre>call acquire (loc ld r4,0(r1) ← blt r4,r2,label sub r4,r2,r4 st r4,0(r1) ←</pre>	call acquire (lock)		
<pre>call release (loc call give_cash</pre>	<pre>ld r4,0(r1) ← blt r4,r2,6 sub r4,r2,r4 st r4,0(r1) ← call release</pre>	300	
Spring 2015	call give_cash CSE 471: Synchronization	4	

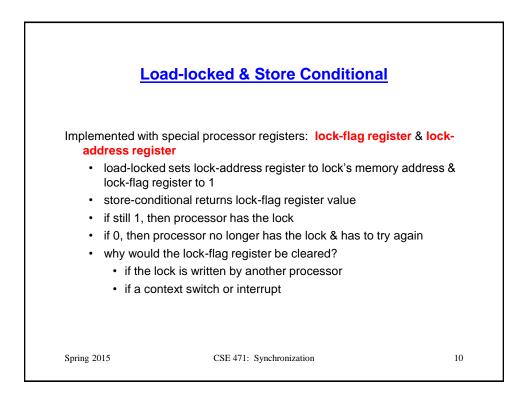

Barriers				
Barrier syr	nchronization			
	arrier: point in a program which all threads must reach before thread can cross			
	threads reach the barrier & then wait until all other threads arrive			
	 all threads are released at once & begin executing code beyond the barrier 			
• exa	mple implementation of a barrier:			
•	 set a lock-protected counter to the number of threads 			
•	each thread decrements the counter			
 when the counter value becomes 0, all threads have crossed the barrier 				
•	 code that implements the counter must be a critical section 			
useful for:				
 programs that execute in (semantic) phases 				
 synchronizing after a parallel loop 				
Spring 2015	CSE 471: Synchronization	5		

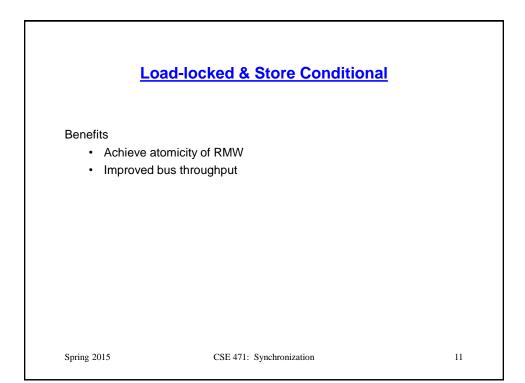

Locking				
Locking facilitate	es access to a critical section & shared data.			
Locking protoco	l:			
 synchro 	nization variable or lock			
• 0: lo	0: lock is available			
• 1: lo	ck is unavailable because another thread holds it			
	obtains the lock before it can enter a critical section o shared data	or		
 sets 	the lock to 1			
	eleases the lock before it leaves the critical section or ccess to shared data	after		
• clear	rs the lock			
Spring 2015	CSE 471: Synchronization	6		

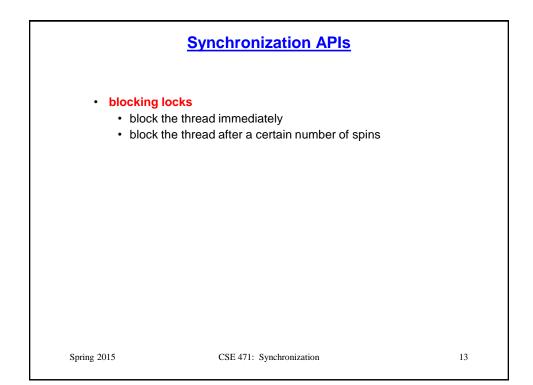

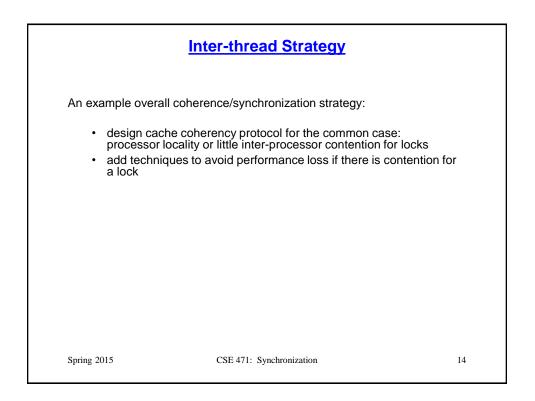

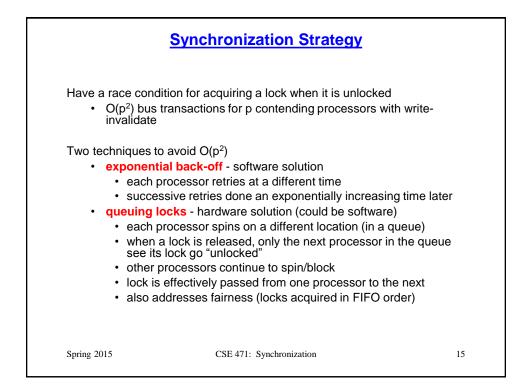

<u>S</u>	<u>ynchro</u>	niza	tion APIs	
User-level software thre with atomic hardware			on library routines consti	ructed
efficient spin loc	cks

	<u>Trickiness</u>			
 Choosing Choosing Coars Fine-g Acquiring 	that are both correct and parallel the locking strategy the right locking granularity se-grain are simple to get correct, but limit paralle grain the opposite & releasing nested locks in the correct order, or locks when they aren't really needed			
Spring 2015	CSE 471: Synchronization	16
