

# DashTricks

An Android tablet app for monitoring key Immunization indicators in health facilities in a given district

## Prototype and Architecture

## Spring Timeline

## Problem

District Immunization Managers don't see the value in their data, and it often goes unused.

At the same time, managers have reported feelings of functioning in a "silo", and lack system-level tools to see the health issues for their district.

## Solution

Provide district immunization managers with a dashboard of key Immunization indicators

## Goal

Give district managers a sense of ownership over their data to realize problems and make decisions intuitively and correctly.
