### CSE P 501 – Compilers

# Parsing & Context-Free Grammars Hal Perkins Winter 2008

### Agenda for Today

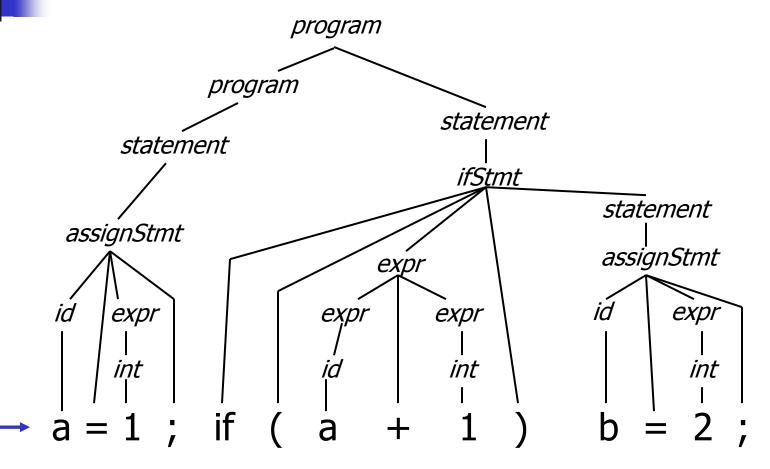

- Parsing overview
- Context free grammars
- Ambiguous grammars
- Reading: Dragon book, ch. 4

### Parsing

- The syntax of most programming languages can be specified by a context-free grammar (CGF)
- Parsing: Given a grammar G and a sentence w in L(G), traverse the derivation (parse tree) for w in some standard order and do something useful at each node
  - The tree might not be produced explicitly, but the control flow of a parser corresponds to a traversal

program ::= statement | program statement
statement ::= assignStmt | ifStmt
assignStmt ::= id = expr;
ifStmt ::= if ( expr ) stmt
expr ::= id | int | expr + expr
Id ::= a | b | c | i | j | k | n | x | y | z
int ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9

- For practical reasons we want the parser to be deterministic (no backtracking), and we want to examine the source program from left to right.
  - (i.e., parse the program in linear time in the order it appears in the source file)

### 4

### Common Orderings

- Top-down
  - Start with the root
  - Traverse the parse tree depth-first, left-to-right (leftmost derivation)
  - LL(k)
- Bottom-up
  - Start at leaves and build up to the root
    - Effectively a rightmost derivation in reverse(!)
  - LR(k) and subsets (LALR(k), SLR(k), etc.)

### "Something Useful"

- At each point (node) in the traversal, perform some semantic action
  - Construct nodes of full parse tree (rare)
  - Construct abstract syntax tree (common)
  - Construct linear, lower-level representation (more common in later parts of a modern compiler)
  - Generate target code on the fly (1-pass compiler; not common in production compilers – can't generate very good code in one pass – but great if you need a quick 'n dirty working compiler)

#### **Context-Free Grammars**

- Formally, a grammar G is a tuple  $\langle N, \Sigma, P, S \rangle$  where
  - N a finite set of non-terminal symbols
  - Σ a finite set of terminal symbols
  - P a finite set of productions
    - A subset of  $N \times (N \cup \Sigma)^*$
  - S the start symbol, a distinguished element of N
    - If not specified otherwise, this is usually assumed to be the non-terminal on the left of the first production

### 4

#### **Standard Notations**

- a, b, c elements of Σ
- w, x, y, z elements of  $\Sigma^*$
- A, B, C elements of N
- X, Y, Z elements of  $N \cup \Sigma$
- $\alpha$ ,  $\beta$ ,  $\gamma$  elements of  $(N \cup \Sigma)^*$
- $A \rightarrow \alpha$  or  $A ::= \alpha$  if  $\langle A, \alpha \rangle$  in P

### Derivation Relations (1)

- $\bullet$   $\alpha A \gamma => \alpha \beta \gamma$  iff  $A ::= \beta$  in P
  - derives
- A =>\* w if there is a chain of productions starting with A that generates w
  - transitive closure

### Derivation Relations (2)

- $\mathsf{w} \mathsf{A} \gamma = \mathsf{I}_{\mathsf{Im}} \mathsf{w} \beta \gamma$  iff  $\mathsf{A} ::= \beta$  in P
  - derives leftmost
- $\alpha A w = >_{rm} \alpha \beta w \text{ iff } A ::= \beta \text{ in } P$ 
  - derives rightmost
- We will only be interested in leftmost and rightmost derivations – not random orderings

## 4

#### Languages

- For A in N,  $L(A) = \{ w \mid A = > * w \}$
- If S is the start symbol of grammar G, define L(G) = L(S)

#### Reduced Grammars

• Grammar G is reduced iff for every production  $A ::= \alpha$  in G there is a derivation

$$S = > * x A z = > x \alpha z = > * xyz$$

- i.e., no production is useless
- Convention: we will use only reduced grammars

### **Ambiguity**

- Grammar G is unambiguous iff every w in L(G) has a unique leftmost (or rightmost) derivation
  - Fact: unique leftmost or unique rightmost implies the other
- A grammar without this property is ambiguous
  - Note that other grammars that generate the same language may be unambiguous
- We need unambiguous grammars for parsing

# Example: Ambiguous Grammar for Arithmetic Expressions

```
expr ::= expr + expr | expr - expr
| expr * expr | expr | expr | expr | int
int ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
```

- Exercise: show that this is ambiguous
  - How? Show two different leftmost or rightmost derivations for the same string
  - Equivalently: show two different parse trees for the same string

### Example (cont)

 Give a leftmost derivation of 2+3\*4 and show the parse tree

### Example (cont)

 Give a different leftmost derivation of 2+3\*4 and show the parse tree

### Another example

Give two different derivations of 5+6+7

### What's going on here?

- The grammar has no notion of precedence or associatively
- Solution
  - Create a non-terminal for each level of precedence
  - Isolate the corresponding part of the grammar
  - Force the parser to recognize higher precedence subexpressions first

### -

### Classic Expression Grammar

```
expr ::= expr + term \mid expr - term \mid term
term ::= term * factor \mid term \mid factor \mid factor
factor ::= int \mid (expr)
int ::= 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7
```

 $expr ::= expr + term \mid expr - term \mid term$ 

term ::= term \* factor | term | factor | factor

factor ::= int | ( expr )

*int* ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7

Check: Derive 2 + 3 \* 4

```
expr ::= expr + term \mid expr - term \mid term
term ::= term * factor \mid term \mid factor \mid factor
factor ::= int \mid (expr)
int ::= 0 \mid 1 \mid 2 \mid 3 \mid 4 \mid 5 \mid 6 \mid 7
```

### Check: Derive 5 + 6 + 7

 Note interaction between left- vs right-recursive rules and resulting associativity

expr ::= expr + term | expr - term | term

term ::= term \* factor | term | factor | factor

factor ::= int | ( expr )

*int* ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7

Check: Derive 5 + (6 + 7)

### **Another Classic Example**

Grammar for conditional statements

```
ifStmt ::= if ( cond ) stmt
| if ( cond ) stmt else stmt
```

- Exercise: show that this is ambiguous
  - How?

#### One Derivation

if ( cond ) if ( cond ) stmt else stmt

#### **Another Derivation**

if ( cond ) if ( cond ) stmt else stmt

### Solving "if" Ambiguity

- Fix the grammar to separate if statements with else clause and if statements with no else
  - Done in Java reference grammar
  - Adds lots of non-terminals
- Use some ad-hoc rule in parser
  - "else matches closest unpaired if"

### Parser Tools and Operators

- Most parser tools can cope with ambiguous grammars
  - Makes life simpler if used with discipline
- Typically one can specify operator precedence & associativity
  - Allows simpler, ambiguous grammar with fewer nonterminals as basis for generated parser, without creating problems

- Possible rules for resolving other problems
  - Earlier productions in the grammar preferred to later ones
  - Longest match used if there is a choice
- Parser tools normally allow for this
  - But be sure that what the tool does is really what you want

### **Coming Attractions**

- Next topic: LR parsing
