CSE P 501 – Compilers

Introduction to Optimization
Hal Perkins
Spring 2018

UW CSE P 501 Spring 2018

Agenda

- Survey some code "optimizations" (improvements)
 - Get a feel for what's possible
- Some organizing concepts
 - Basic blocks
 - Control-flow and dataflow graph
 - Analysis vs. transformation

UW CSE P 501 Spring 2018

Optimizations

- Use added passes to identify inefficiencies in intermediate or target code
- Replace with equivalent but better sequences
 - Equivalent = "has same externally visible behavior"
 - Better can mean many things: faster, smaller, less power, etc.
- "Optimize" overly optimistic: "usually improve" is generally more accurate
 - And "clever" programmers can outwit you!

UW CSE P 501 Spring 2018

```
-t1 = *(fp + ioffset); // i
x = a[i] + b[2];
                   \Rightarrow t2 = t1 * 4:
c[i] = x - 5;
                     _{1} t3 = fp + t2;
                     -t4 = *(t3 + aoffset); // a[i]
                      -t5 = 2;
                    * . t6 = t5 * 4;
                     - t7 = fp + t6;
                     - t8 = *(t7 + boffset); // b[2]
                     7 t9 = t4 + t8:
                     *(fp + xoffset) = t9; // x = ...
                     -t10 = *(fp + xoffset); // x
                     - t11 = 5;
                     - t12 = t10 - t11;
                     - t13 = *(fp + ioffset); // i
                   \Rightarrow - t14 = t13 * 4;
                     - t15 = fp + t14;
                     -*(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Strength reduction: shift often cheaper than multiply

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2; // was t1 * 4
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t5 = 2:
=t6 = t5 << 2; // was t5 * 4
t7 = fp + t6;
t8 = *(t7 + boffset); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t11 = 5;
-t12 = t10 - t11;
t13 = *(fp + ioffset); // i
t14 = t13 << 2; // was t13 * 4
t15 = fp + t14;
 *(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Constant propagation: replace variables with known constant values

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
-t5 = 2;
t6 = 2 << 2; // was t5 << 2
7t7 = fp + t6;
t8 = *(t7 + boffset); // b[2]
t9 = t4 + t8;
\star(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t11 = 5;
xt12 = t10 - 5; // was t10 - t11
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
 *(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Dead store (or dead assignment) elimination: remove assignments to provably unused variables

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
 t5 - 2;
t6 = 2 << 2; -
t7 = fp + t6;
t8 = *(t7 + boffset); // b[2]
t9 = t4 + t8;
\star(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
¥t11 - 5;
t12 = t10 - 5;
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
 *(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Constant folding: statically compute operations with known constant values

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t6 = 8; // was 2 << 2
t7 = fp + t6;
t8 = *(t7 + boffset); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t12 = t10 - 5;
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Constant propagation then dead store elimination

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t6 = 8;

7t7 = fp + 8; // was fp + t6
t8 = *(t7 + boffset); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t12 = t10 - 5;
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Arithmetic identities: + is commutative & associative. boffset is typically a known, compile-time constant (say -32), so this enables...

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t7 = boffset + 8; // was fp + 8

*t8 = *(t7 + fp); // b[2] (was t7 + boffset)
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t12 = t10 - 5;
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

... more constant folding, which in turn enables ...

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

More constant propagation and dead store elimination

```
- t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t7 = -24;

/t8 = *(fp - 24); // b[2] (was t7+fp)
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t12 = t10 - 5;
t13 = *(fp + ioffset); // i
t14 = t13 << 2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Common subexpression elimination – no need to compute *(fp+ioffset) again if we know it won't change

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t8 = *(fp - 24); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = *(fp + xoffset); // x
t12 = t10 - 5;
>t13 = t1; // i (was *(fp + ioffset))
t14 = t13 << 2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Copy propagation: replace assignment targets with their values (e.g., replace t13 with t1)

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t8 = *(fp - 24); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
*t10 = t9; // x (was *(fp + xoffset))
t12 = t10 - 5;
t13 = t1; // i
*t14 = t1 << 2; // was t13 << 2
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

Common subexpression elimination

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t8 = *(fp - 24); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = t9; // x
t12 = t10 - 5;
t13 = t1; // i
*t14 = t2; // was t1 << 2
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

More copy propagation

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t8 = *(fp - 24); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t10 = t9; // x

*t12 = t9 - 5; // was t10 - 5
t13 = t1; // i
t14 = t2;
t15 = fp + t14;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

More copy propagation

```
t1 = *(fp + ioffset); // i

t2 = t1 << 2;

t3 = fp + t2;

t4 = *(t3 + aoffset); // a[i]

t8 = *(fp - 24); // b[2]

t9 = t4 + t8;

*(fp + xoffset) = t9; // x = ...

t10 = t9; // x

t12 = t9 - 5;

t13 = t1; // i

t14 = t2;

t15 = fp + t2; // was fp + t14

*(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
t1 = *(fp + ioffset); // i
    x = a[i] + b[2];
                          t2 = t1 << 2;
    c[i] = x - 5;
                          t3 = fp + t2;
                          t4 = *(t3 + aoffset); // a[i]
                          t8 = *(fp - 24); // b[2]
                          t9 = t4 + t8;
                           \star(fp + xoffset) = t9; // x = ...
Dead assignment
                          >t10 - t9; // x
elimination
                          t12 = t9 - 5;
                           t13 = t1; // i
                          t14 = t2;
                          t15 = fp + t2;
                           *(t15 + coffset) = t12; // c[i] := ...
```

UW CSE P 501 Spring 2018

```
x = a[i] + b[2];

c[i] = x - 5;
```

```
t1 = *(fp + ioffset); // i
t2 = t1 << 2;
t3 = fp + t2;
t4 = *(t3 + aoffset); // a[i]
t8 = *(fp - 24); // b[2]
t9 = t4 + t8;
*(fp + xoffset) = t9; // x = ...
t12 = t9 - 5;
t15 = fp + t2;
*(t15 + coffset) = t12; // c[i] := ...</pre>
```

- Final: 3 loads (i, a[i], b[2]), 2 stores (x, c[i]), 5 register-only moves, 9 +/-, 1 shift
- Original: 5 loads, 2 stores, 10 register-only moves, 12 +/-, 3 *
- Optimizer note: we usually leave assignment of actual registers to later stage of the compiler and assume as many "pseudo registers" as we need here

UW CSE P 501 Spring 2018

Kinds of optimizations

- peephole: look at adjacent instructions
- local: look at individual basic blocks
 - straight-line sequence of statements
- intraprocedural: look at whole procedure
 - Commonly called "global"
- interprocedural: look across procedures
 - "whole program" analysis
 - gcc's "link time optimization" is a version of this
- Larger scope => usually better optimization but more cost and complexity
 - Analysis is often less precise because of more possibilities

UW CSE P 501 Spring 2018

Peephole Optimization

- After target code generation, look at adjacent instructions (a "peephole" on the code stream)
 - try to replace adjacent instructions with something faster

```
movq %r9,16(%rsp) movq %r9,16(%rsp) movq %r9,%r12 movq %r9,%r12
```

 Jump chaining can also be considered a form of peephole optimization (removing jump to jump)

UW CSE P 501 Spring 2018

More Examples

```
subq $8,%rax
movq %r2,0(%rax)
# %rax overwritten

movq 16(%rsp),%rax
addq $1,%rax
movq %rax,16(%rsp)
# %rax overwritten
incq 16(%rsp)
```

One way to do complex instruction selection

UW CSE P 501 Spring 2018

Algebraic Simplification

"constant folding", "strength reduction"

```
-z = 3 + 4; \rightarrow z = 7
-z = x + 0; \rightarrow z = x
-z = x * 1; \rightarrow z = x
-z = x * 2; \rightarrow z = x << 1 \text{ or } z = x + x
-z = x * 8; \rightarrow z = x << 3
-z = x / 8; \rightarrow z = x >> 3 \text{ (only if } x>=0 \text{ known)}
-z = (x + y) - y; \rightarrow z = x \text{ (maybe; not doubles, might change int overflow)}
```

- Can be done at many levels from peephole on up
- Why do these examples happen?
 - Often created during conversion to lower-level IR, by other optimizations, code gen, etc.

UW CSE P 501 Spring 2018

Local Optimizations

- Analysis and optimizations within a basic block
- Basic block: straight-line sequence of statements
 - no control flow into or out of middle of sequence
- Better than peephole
- Not too hard to implement with reasonable IR
- Machine-independent, if done on IR

UW CSE P 501 Spring 2018

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; unoptimized intermediate code:

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; constant propagation:

```
count = 10;

... // count not changed

x = count * 5;

y = x ^ 3;

x = 7;

count = 10;

t1 = 10; // cp count

t2 = 5;

t3 = 10 * t2; // cp t1

x = t3;

t4 = x;

t5 = 3;

t6 = exp(t4,3); // cp t5

y = t6;

x = 7
```

UW CSE P 501 Spring 2018

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; constant folding:

UW CSE P 501 Spring 2018

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; repropagated intermediate code

UW CSE P 501 Spring 2018

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; refold intermediate code

UW CSE P 501 Spring 2018

- If variable assigned a constant, replace downstream uses of the variable with constant (until variable reassigned)
- Can enable more constant folding
 - Code; repropagated intermediate code

UW CSE P 501 Spring 2018

Local Dead Assignment Elimination

- If I.h.s. of assignment never referenced again before being overwritten, then can delete assignment
 - Why would this happen?
 Clean-up after previous optimizations, often

Local Dead Assignment Elimination

- If I.h.s. of assignment never referenced again before being overwritten, then can delete assignment
 - Why would this happen?
 Clean-up after previous optimizations, often

```
count = 10;

... // count not changed

x = count * 5;

y = x ^ 3;

x = 7;

count = 10;

t1 = 10;

t2 = 5;

t3 = 50;

x = 50;

t4 = 50;

t5 = 3;

t6 = 125000;

y = 125000;

x = 7;
```

UW CSE P 501 Spring 2018

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = *(fp + ioffset);

t6 = t5 * 4;

t7 = fp + t6;

t8 = *(t7 + boffset);

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = t1; // CSE

t6 = t5 * 4;

t7 = fp + t6;

t8 = *(t7 + boffset);

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = t1;

t6 = t1 * 4; // CP

t7 = fp + t6;

t8 = *(t7 + boffset);

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = t1;

t6 = t2;  // CSE

t7 = fp + t2; // CP

t8 = *(t7 + boffset);

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

Local Common Subexpression Elimination

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = t1;

t6 = t2;

t7 = t3; // CSE

t8 = *(t3 + boffset); //cse

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

Local Common Subexpression Elimination

- Look for repetitions of the same computation. Eliminate them if result won't have changed and no side effects
 - Avoid repeated calculation and eliminates redundant loads
- Idea: walk through basic block keeping track of available expressions

```
t1 = *(fp + ioffset);

t2 = t1 * 4;

t3 = fp + t2;

t4 = *(t3 + aoffset);

t5 = t1; // DAE

t6 = t2; // DAE

t7 = t3; // DAE

t8 = *(t3 + boffset);

t9 = t4 + t8;
```

UW CSE P 501 Spring 2018

Intraprocedural optimizations

- Enlarge scope of analysis to whole procedure
 - more opportunities for optimization
 - have to deal with branches, merges, and loops
- Can do constant propagation, common subexpression elimination, etc. at "global" level
- Can do new things, e.g. loop optimizations
- Optimizing compilers usually work at this level (-O2)

UW CSE P 501 Spring 2018

Code Motion

- Goal: move loop-invariant calculations out of loops
- Can do at source level or at intermediate code level

```
for (i = 0; i < 10; i = i+1) {
    a[i] = a[i] + b[j];
    z = z + 10000;
}

t1 = b[j];
t2 = 10000;
for (i = 0; i < 10; i = i+1) {
    a[i] = a[i] + t1;
    z = z + t2;
}
```

Code Motion at IL

```
for (i = 0; i < 10; i = i+1) {
  a[i] = b[j];
*(fp + ioffset) = 0;
label top;
r t0 = *(fp + ioffset);
iffalse (t0 < 10) goto done;
r t1 = *(fp + joffset);
t2 = t1 * 4;
  t3 = fp + t2;
_{r} t4 = *(t3 + boffset);
  t5 = *(fp + ioffset);
  t6 = t5 * 4;
  t7 = fp + t6;
  *(t7 + aoffset) = t4;
  t9 = *(fp + ioffset);
t10 = t9 + 1;
  *(fp + ioffset) = t10;
  goto top;
label done;
```

UW CSE P 501 Spring 2018

Code Motion at IL

```
for (i = 0; i < 10; i = i+1) {
  a[i] = b[j];
t11 = fp + ioffset; t13 = fp + aoffset;
t12 = fp + joffset; t14 = fp + boffset
*(fp + ioffset) = 0;
label top;
 t0 = *t11;
  iffalse (t0 < 10) goto done;
 t1 = *t12;
  t2 = t1 * 4;
 t3 = t14;
  t4 = *(t14 + t2);
 t5 = *t11;
  t6 = t5 * 4;
 t7 = t13;
  *(t13 + t6) = t4;
 t9 = *t11;
  t10 = t9 + 1;
  *t11 = t10;

Loop Induction Variable Elimination

- A special and common case of loop-based strength reduction
- For-loop index is induction variable
 - incremented each time around loop
 - offsets & pointers calculated from it
- If used only to index arrays, can rewrite with pointers
 - compute initial offsets/pointers before loop
 - increment offsets/pointers each time around loop
 - no expensive scaling in loop
 - can then do loop-invariant code motion

```
for (i = 0; i < 10; i = i+1) {
    a[i] = a[i] + x;
}
=> transformed to
for (p = &a[0]; p < &a[10]; p = p+4) {
    -*p = *p + x;
}</pre>
```

UW CSE P 501 Spring 2018

Interprocedural Optimization

- Expand scope of analysis to procedures calling each other
- Can do local & intraprocedural optimizations at larger scope
- Can do new optimizations, e.g. inlining

UW CSE P 501 Spring 2018

Inlining: replace call with body

- Replace procedure call with body of called procedure
- Source:

(Then what? Constant propagation/folding)

UW CSE P 501 Spring 2018

Data Structures for Optimizations

- Need to represent control and data flow
- Control flow graph (CFG) captures flow of control
 - nodes are IL statements, or whole basic blocks
 - edges represent (all possible) control flow
 - node with multiple successors = branch/switch
 - node with multiple predecessors = merge
 - loop in graph = loop
- Data flow graph (DFG) captures flow of data, e.g. def/use chains:
 - nodes are def(inition)s and uses
 - edge from def to use
 - a def can reach multiple uses
 - a use can have multiple reaching defs (different control flow paths, possible aliasing, etc.)
- SSA: another widely used way of linking defs and uses

UW CSE P 501 Spring 2018

Analysis and Transformation

- Each optimization is made up of
 - some number of analyses
 - followed by a transformation
- Analyze CFG and/or DFG by propagating info forward or backward along CFG and/or DFG edges
 - merges in graph require combining info
 - loops in graph require iterative approximation
- Perform (improving) transformations based on info computed
- Analysis must be conservative/safe/sound so that transformations preserve program behavior

UW CSE P 501 Spring 2018

Summary

- Optimizations organized as collections of passes, each rewriting IL in place into (hopefully) better version
- Each pass does analysis to determine what is possible, followed by transformation(s) that (hopefully) improve the program
 - Sometimes "analysis-only" passes are helpful
 - Often redo analysis/transformations again to take advantage of possibilities revealed by previous changes
- Presence of optimizations makes other parts of compiler (e.g. intermediate and target code generation) easier to write
