# Practical Aspects of 

 Modern CryptographyWinter 2011
Josh Benaloh Brian LaMacchia

## Public-Key History

- 1976 New Directions in Cryptography Whit Diffie and Marty Hellman
- One-Way functions
- Diffie-Hellman Key Exchange
- 1978 RSA paper

Ron Rivest, Adi Shamir, and Len Adleman

- RSA Encryption System
- RSA Digital Signature Mechanism

## The Fundamental Equation

$$
Z=Y^{x} \bmod \mathbb{N}
$$

## Diffie-Hellman

$$
\underline{Z}=Y^{X} \operatorname{rrod} \mathbb{N}
$$

When $X$ is unknown, the problem is known as the discrete logarithm and is generally believed to be hard to solve.

## Diffie-Hellman Key Exchange

## Alice

- Randomly select a large integer $a$ and send $A=Y^{a} \bmod N$.
- Compute the key
$K=B^{a} \bmod N$.
- Randomly select a large integer $b$ and send $B=Y^{b} \bmod N$.
- Compute the key $K=A^{b} \bmod N$.

$$
\mathrm{B}^{a}=\mathrm{Y}^{b a}=\mathrm{Y}^{a b}=\mathrm{A}^{b}
$$

## One-Way Trap-Door Functions

$$
Z=Y^{x} \bmod \mathbb{N}
$$

Recall that this equation is solvable for $Y$ if the factorization of $N$ is known, but is believed to be hard otherwise.

## RSA Public-Key Cryptosystem

## Alice

- Select two large random primes P \& Q.
- Publish the product $\mathrm{N}=\mathrm{PQ}$.
- Use knowledge of P \&

Q to compute $Y$.

## Why Does RSA Work?

Fact

When $N=P Q$ is the product of distinct primes,

$$
Y^{X} \bmod N=Y
$$

whenever
$X \bmod (P-1)(Q-1)=1$ and $0 \leq Y<N$.

## Fermat's Little Theorem

If $p$ is prime,
then $x^{p-1} \bmod p=1$ for all $0<x<p$.
Equivalently ...
If $p$ is prime, then

$$
x^{p} \bmod p=x \bmod p
$$

for all integers $x$.

## Proof of Fermat's Little Theorem

## The Binomial Theorem

$$
(x+y)^{p}=\sum_{i=0}^{p}\binom{n}{i} x^{i} y^{p-i} \text { where }\binom{p}{i}=\frac{p!}{i!(p-i)!}
$$

## Proof of Fermat's Little Theorem

## The Binomial Theorem

$$
(x+y)^{p}=\sum_{i=0}^{p}\binom{n}{i} x^{i} y^{p-i} \text { where }\binom{p}{i}=\frac{p!}{i!(p-i)!}
$$

If $p$ is prime, then $\binom{p}{i}=0$ for $0<i<p$.

## Proof of Fermat's Little Theorem

## The Binomial Theorem

$(x+y)^{p}=\sum_{i=0}^{p}\binom{n}{i} x^{i} y^{p-i}$ where $\binom{p}{i}=\frac{p!}{i!(p-i)!}$

If $p$ is prime, then $\binom{p}{i}=0$ for $0<i<p$.

Thus, $(x+y)^{p} \bmod p=(x p+y p) \bmod p$.

# Proof of Fermat's Little Theorem 

## $x^{p} \bmod p=x \bmod p$

# Proof of Fermat's Little Theorem $x^{p} \bmod p=x \bmod p$ 

By induction on $x$...

# Proof of Fermat's Little Theorem $x^{p} \bmod p=x \bmod p$ 

By induction on $x$...

## Basis

# Proof of Fermat's Little Theorem $x^{p} \bmod p=x \bmod p$ 

 By induction on $x \ldots$
## Basis

If $x=0$, then $x^{p} \bmod p=0=x \bmod p$.

## Proof of Fermat's Little Theorem

$$
x^{p} \bmod p=x \bmod p
$$

## By induction on $x$...

## Basis

If $x=0$, then $x^{p} \bmod p=0=x \bmod p$.
If $x=1$, then $x^{p} \bmod p=1=x \bmod p$.

## Proof of Fermat's Little Theorem

## Inductive Step

## Proof of Fermat's Little Theorem

## Inductive Step

Assume that $x^{p} \bmod p=x \bmod p$.

## Proof of Fermat's Little Theorem

## Inductive Step

Assume that $x^{p} \bmod p=x \bmod p$.
Then $(x+1)^{p} \bmod p=\left(x^{p}+1^{p}\right) \bmod p$
(by the binomial theorem)

## Proof of Fermat's Little Theorem

## Inductive Step

Assume that $x^{p} \bmod p=x \bmod p$.
Then $(x+1)^{p} \bmod p=\left(x^{p}+1^{p}\right) \bmod p$

$$
=(x+1) \bmod p \text { (by inductive hypothesis). }
$$

## Proof of Fermat's Little Theorem

## Inductive Step

Assume that $x^{p} \bmod p=x \bmod p$.
Then $(x+1)^{p} \bmod p=\left(x^{p}+1^{p}\right) \bmod p$

$$
=(x+1) \bmod p \text { (by inductive hypothesis). }
$$

Hence, $x^{p} \bmod p=x \bmod p$ for integers $x \geq 0$.

## Proof of Fermat's Little Theorem

## Inductive Step

Assume that $x^{p} \bmod p=x \bmod p$.
Then $(x+1)^{p} \bmod p=\left(x^{p}+1^{p}\right) \bmod p$ $=(x+1) \bmod p$ (by inductive hypothesis).
Hence, $x^{p} \bmod p=x \bmod p$ for integers $x \geq 0$.
Also true for negative $x$, since $(-x)^{p}=(-1)^{p} x^{p}$.

## Proof of RSA

## Proof of RSA

## We have shown ...

$$
\begin{gathered}
Y^{P} \bmod P=Y \text { whenever } 0 \leq Y<P \\
\text { and } P \text { is prime. }
\end{gathered}
$$

## Proof of RSA

We have shown ...

$$
\begin{gathered}
Y^{P} \bmod P=Y \text { whenever } 0 \leq Y<P \\
\text { and } P \text { is prime. }
\end{gathered}
$$

You will show ...
$Y^{K(P-1)(Q-1)+1} \bmod P Q=Y$ when $0 \leq Y<P Q$
$P$ and $Q$ are distinct primes and $K \geq 0$.

## Corollary of Fermat

$$
\begin{gathered}
x^{p} \bmod p=x \bmod p \\
\Downarrow
\end{gathered}
$$

$x^{k(p-1)+1} \bmod p=x \bmod p$
For all prime $p$ and $k \geq 0$.

## Finding Primes

## Finding Primes

## Euclid's proof of the infinity of primes

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.
- Consider $N+1$.

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.
- Consider $N+1$. Is $N+1$ prime or composite?

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.
- Consider $N+1$. Is $N+1$ prime or composite?
- The prime factors of $N+1$ are not among the finite set of primes multiplied to form $N$.

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.
- Consider $N+1$. Is $N+1$ prime or composite?
- The prime factors of $N+1$ are not among the finite set of primes multiplied to form $N$.
- So $N$ must be a prime not in the set.

## Finding Primes

## Euclid's proof of the infinity of primes

- Suppose that the set of all primes were finite.
- Let $N$ be the product of all of the primes.
- Consider $N+1$. Is $N+1$ prime or composite?
- The prime factors of $N+1$ are not among the finite set of primes multiplied to form $N$.
- So $N$ must be a prime not in the set.
- This contradicts the assumption that the set of all primes is finite.

## The Prime Number Theorem

## The Prime Number Theorem

## The number of primes less than $N$ is approximately $N /(\ln N)$.

## The Prime Number Theorem

The number of primes less than $N$ is approximately $N /(\ln N)$.

Thus, approximately 1 out of every $n$ randomly selected $n$-bit integers will be prime.

## But How Do We Find Primes?

## Testing Primality

## Testing Primality

## Recall Fermat's Little Theorem

If $p$ is prime, then $a^{p-1} \bmod p=1$ for all $a$ in the range $0<a<p$.

## Testing Primality

Recall Fermat's Little Theorem
If $p$ is prime, then $a^{p-1} \bmod p=1$ for all $a$ in the range $0<a<p$.

## Fact

For almost all composite $p$ and $a>1$, $a^{p-1} \bmod p \neq 1$.

## The Miller-Rabin Primality Test

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

Repeat several (many) times

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

Repeat several (many) times

- Select a random $a$ in $1<a<N-1$

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

Repeat several (many) times

- Select a random $a$ in $1<a<N-1$
- Compute $a^{m}, a^{2 m}, a^{4 m}, \ldots, a^{(N-1) / 2}$ all $\bmod N$.

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

Repeat several (many) times

- Select a random $a$ in $1<a<N-1$
- Compute $a^{m}, a^{2 m}, a^{4 m}, \ldots, a^{(N-1) / 2}$ all $\bmod N$.
- If $a^{m}= \pm 1$ or if some $a^{2^{i} m}=-1$, then $N$ is probably prime - continue.

## The Miller-Rabin Primality Test

To test an integer $N$ for primality, write $N-1$ as $N-1=m 2^{k}$ where $m$ is odd.

Repeat several (many) times

- Select a random $a$ in $1<a<N-1$
- Compute $a^{m}, a^{2 m}, a^{4 m}, \ldots, a^{(N-1) / 2}$ all $\bmod N$.
- If $a^{m}= \pm 1$ or if some $a^{2^{i} m}=-1$, then $N$ is probably prime - continue.
- Otherwise, $N$ is composite - stop.

$$

## The Digital Signature Algorithm

In 1991, the National Institute of
Standards and Technology published a
Digital Signature Standard that was
intended as an option free of intellectual property constraints.

## The Digital Signature Algorithm

DSA uses the following parameters

- Prime $p$ - anywhere from 512 to 1024 bits
- Prime $q-160$ bits such that $q$ divides $p-1$
- Integer $h$ in the range $1<h<p-1$
- Integer $g=h^{(p-1) / q} \bmod p$
- Secret integer $x$ in the range $1<x<q$
- Integer $y=g^{x} \bmod p$

## The Digital Signature Algorithm

## The Digital Signature Algorithm

To sign a 160-bit message $M$,

## The Digital Signature Algorithm

To sign a 160-bit message $M$,

- Generate a random integer $k$ with $0<k<q$,

## The Digital Signature Algorithm

To sign a 160-bit message $M$,

- Generate a random integer $k$ with $0<k<q$,
- Compute $r=\left(g^{k} \bmod p\right) \bmod q$,

## The Digital Signature Algorithm

To sign a 160-bit message $M$,

- Generate a random integer $k$ with $0<k<q$,
- Compute $r=\left(g^{k} \bmod p\right) \bmod q$,
- Compute $s=((M+x r) / k) \bmod q$.

## The Digital Signature Algorithm

To sign a 160-bit message $M$,

- Generate a random integer $k$ with $0<k<q$,
- Compute $r=\left(g^{k} \bmod p\right) \bmod q$,
- Compute $s=((M+x r) / k) \bmod q$.

The pair $(r, s)$ is the signature on $M$.

## The Digital Signature Algorithm

# The Digital Signature Algorithm 

A signature $(r, s)$ on $M$ is verified as follows:

## The Digital Signature Algorithm

A signature $(r, s)$ on $M$ is verified as follows:

- Compute $w=1 / s \bmod q$,

## The Digital Signature Algorithm

A signature $(r, s)$ on $M$ is verified as follows:

- Compute $w=1 / s \bmod q$,
- Compute $a=w M \bmod q$,

## The Digital Signature Algorithm

A signature $(r, s)$ on $M$ is verified as follows:

- Compute $w=1 / s \bmod q$,
- Compute $a=w M \bmod q$,
- Compute $b=w r \bmod q$,

## The Digital Signature Algorithm

A signature $(r, s)$ on $M$ is verified as follows:

- Compute $w=1 / s \bmod q$,
- Compute $a=w M \bmod q$,
- Compute $b=w r \bmod q$,
- Compute $v=\left(g^{a} y^{b} \bmod p\right) \bmod q$.

## The Digital Signature Algorithm

A signature $(r, s)$ on $M$ is verified as follows:

- Compute $w=1 / s \bmod q$,
- Compute $a=w M \bmod q$,
- Compute $b=w r \bmod q$,
- Compute $v=\left(g^{a} y^{b} \bmod p\right) \bmod q$.

Accept the signature only if $v=r$.

$$

when $x_{1}=x_{2}$ but $y_{1} \neq y_{2}$ or $y_{1}=y_{2}=0$

$$
\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right) \times I=\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)=I \times\left(\mathrm{x}_{1}, \mathrm{y}_{1}\right)
$$

$$
I \times I=I
$$

## The Fundamental Equation

$$
Z=Y^{x} \bmod \mathbb{N}
$$

## The Fundamental Equation

$$
\underline{Z}=Y^{X} \operatorname{in} E_{p}(A, B)
$$

## The Fundamental Equation

$$
\underline{Z}=Y X \operatorname{in} E_{p}(A, B)
$$

When $Z$ is unknown, it can be efficiently computed by repeated squaring.

## The Fundamental Equation

$$
I=Y^{X} \operatorname{in} E_{p}(A, B)
$$

When $X$ is unknown, this version of the discrete logarithm is believed to be quite hard to solve.

## The Fundamental Equation

$$
I=Y X \text { in } E_{p}(A, B)
$$

When $Y$ is unknown, it can be efficiently computed by "sophisticated" means.

## Diffie-Hellman Key Exchange

## Alice

- Randomly select a large integer $a$ and send $A=Y^{a} \bmod N$.
- Compute the key
$K=B^{a} \bmod N$.
- Randomly select a large integer $b$ and send $B=Y^{b} \bmod N$.
- Compute the key $K=A^{b} \bmod N$.

$$
\mathrm{B}^{a}=\mathrm{Y}^{b a}=\mathrm{Y}^{a b}=\mathrm{A}^{b}
$$

## Diffie-Hellman Key Exchange

## Alice

- Randomly select a
large integer $a$ and
send $A=Y^{a}$ in $E_{p}$.
- Compute the key
$\mathrm{K}=\mathrm{B}^{a}$ in $\mathrm{E}_{\mathrm{p}}$.
- Randomly select a large integer $b$ and send $B=Y^{b}$ in $E_{p}$.
- Compute the key $K=A^{b}$ in $E_{p}$.

$$
\mathrm{B}^{a}=\mathrm{Y}^{b a}=\mathrm{Y}^{a b}=\mathrm{A}^{b}
$$

## DSA on Elliptic Curves

## DSA on Elliptic Curves

- Almost identical to DSA over the integers.

## DSA on Elliptic Curves

- Almost identical to DSA over the integers.
- Replace operations mod $p$ and $q$ with operations in $\mathrm{E}_{p}$ and $\mathrm{E}_{q}$.

## Why use Elliptic Curves?

## Why use Elliptic Curves?

- The best currently known algorithm for EC discrete logarithms would take about as long to find a 160-bit EC discrete log as the best currently known algorithm for integer discrete logarithms would take to find a 1024-bit discrete log.

## Why use Elliptic Curves?

- The best currently known algorithm for EC discrete logarithms would take about as long to find a 160-bit EC discrete log as the best currently known algorithm for integer discrete logarithms would take to find a 1024-bit discrete log.
- 160-bit EC algorithms are somewhat faster and use shorter keys than 1024-bit "traditional" algorithms.

## Why not use Elliptic Curves?

## Why not use Elliptic Curves?

- EC discrete logarithms have been studied far less than integer discrete logarithms.

## Why not use Elliptic Curves?

- EC discrete logarithms have been studied far less than integer discrete logarithms.
- Results have shown that a fundamental break in integer discrete logs would also yield a fundamental break in EC discrete logs, although the reverse may not be true.

## Why not use Elliptic Curves?

- EC discrete logarithms have been studied far less than integer discrete logarithms.
- Results have shown that a fundamental break in integer discrete logs would also yield a fundamental break in EC discrete logs, although the reverse may not be true.
- Basic EC operations are more cumbersome than integer operations, so EC is only faster if the keys are much smaller.

## Symmetric

## Cryptography

## The Practical Side

For efficiency, one generally uses RSA (or another public-key algorithm) to transmit a private (symmetric) key.
The private session key is used to encrypt and authenticate any subsequent data.

Digital signatures are only used to sign a digest of the message.

## One-Way Hash Functions

Generally, a one-way hash function is a function $\mathrm{H}:\{0,1\}^{*} \rightarrow\{0,1\}^{\mathrm{k}}$ (typically k is $128,160,256,384$, or 512 ) such that given an input value $x$, one cannot find a value $x^{\prime} \neq x$ such $H(x)=H\left(x^{\prime}\right)$.

## One-Way Hash Functions

There are many measures for one-way hashes.

- Non-invertability: given $y$, it's difficult to find any $x$ such that $H(x)=y$.
- Collision-intractability: one cannot find a pair of values $x^{\prime} \neq x$ such that $H(x)=H\left(x^{\prime}\right)$.

## One-Way Hash Functions

- When using a stream cipher, a hash of the message can be appended to ensure integrity. [Message Authentication Code]
- When forming a digital signature, the signature need only be applied to a hash of the message. [Message Digest]
