# Practical Aspects of 

 Modern CryptographyWinter 2011
Josh Benaloh Brian LaMacchia

## Fun with Public-Key

Tonight we'll ...

- Introduce some basic tools of public-key crypto
- Combine the tools to create more powerful tools
- Lay the ground work for substantial applications

## Challenge-Response Protocols

## Challenge-Response Protocols

One party often wants to convince another party that something is true ...

## Challenge-Response Protocols

One party often wants to convince another party that something is true ...
... without giving everything away.

## Proof of Knowledge

"I know the secret key $k$."

## PoK: Method 1

## PoK: Method 1

## Here is $k$.

## PoK: Method 2

## PoK: Method 2

## Here is a nonce $c$.

## PoK: Method 2

Here is a nonce $c$.

Here is the hash $h(c, k)$.

## Traditional Proofs

## Traditional Proofs

## I want to convince you that something is true.

## Traditional Proofs

## I want to convince you that something is true.

I write down a proof and give it to you.

## Interactive Proofs

We engage in a dialogue at the conclusion of which you are convinced that my claim is true.

## Graph Isomorphism

## Graph Isomorphism

## Graph Isomorphism

## IP of Graph Isomorphism

$\mathrm{G}_{2}$

## IP of Graph Isomorphism

Generate, say, 100 additional graphs isomorphic to $\mathrm{G}_{1}$ (and therefore also isomorphic to $\mathrm{G}_{2}$ ).

## IP of Graph Isomorphism

## $\mathrm{H}_{1}$

$\mathrm{H}_{2}$
$\mathrm{H}_{3}$

## $\mathrm{H}_{100}$

## IP of Graph Isomorphism

## IP of Graph Isomorphism

Accept a single bit challenge " $L / R$ " for each of the 100 additional graphs.

## IP of Graph Isomorphism

Accept a single bit challenge " $L / R$ " for each of the 100 additional graphs.

Display the indicated isomorphism for each of the additional graphs.

## IP of Graph Isomorphism

## $\mathrm{H}_{1}$

$\mathrm{H}_{2}$
$\mathrm{H}_{3}$

## $\mathrm{H}_{100}$

## IP of Graph Isomorphism

 L $\mathrm{H}_{1}$$\mathrm{H}_{2} \mathrm{R}$
$\mathrm{H}_{3} \mathrm{R}$

L $\mathrm{H}_{100}$

## IP of Graph Isomorphism

## IP of Graph Isomorphism

## IP of Graph Isomorphism

If graphs $G_{1}$ and $G_{2}$ were not isomorphic, then the "prover" would not be able to show any additional graph to be isomorphic to both $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$.

## IP of Graph Isomorphism

If graphs $G_{1}$ and $G_{2}$ were not isomorphic, then the "prover" would not be able to show any additional graph to be isomorphic to both $\mathrm{G}_{1}$ and $\mathrm{G}_{2}$.

A successful false proof would require the prover to guess all 100 challenges in advance: probability 1 in $2^{100}$.

## Fiat-Shamir Heuristic

## Fiat-Shamir Heuristic

Instead of challenge bits being externally generated, they can be produced by applying a one-way hash function to the full set of additional graphs.

## Fiat-Shamir Heuristic

Instead of challenge bits being externally generated, they can be produced by applying a one-way hash function to the full set of additional graphs.

This allows an interactive proof to be "published" without need for interaction.

## IP of Graph Non-Isomorphism

## IP of Graph Non-Isomorphism

$\mathrm{G}_{2}$

## IP of Graph Non-Isomorphism

A verifier can generate 100 additional graphs, each isomorphic to one of $G_{1}$ and $G_{2}$, and present them to the prover.

## IP of Graph Non-Isomorphism

A verifier can generate 100 additional graphs, each isomorphic to one of $G_{1}$ and $G_{2}$, and present them to the prover.

The prover can then demonstrate that the graphs are not isomorphic by identifying which of $G_{1}$ and $G_{2}$ each additional graph is isomorphic to.

## IP of Graph Non-Isomorphism

$\mathrm{G}_{2}$

## IP of Graph Non-Isomorphism

## $\mathrm{H}_{1}$

$\mathrm{H}_{2}$
$\mathrm{H}_{3}$

## $\mathrm{H}_{100}$

## IP of Graph Non-Isomorphism

## Proving Something is a Square

## Proving Something is a Square

 Suppose I want to convince you that $Y$ is a square modulo $N$.[There exists an $X$ such that $\left.Y=X^{2} \bmod N.\right]$

## Proving Something is a Square

 Suppose I want to convince you that $Y$ is a square modulo $N$.[There exists an $X$ such that $\left.Y=X^{2} \bmod N.\right]$

First approach: I give you $X$.

## An Interactive Proof

$$
Y
$$

$$
\begin{array}{llllllllll}
Y_{1} & Y_{2} & Y_{3} & Y_{4} & Y_{5} & \cdots \cdots \cdots \cdots & Y_{100}
\end{array}
$$

## An Interactive Proof

\[

\]

## An Interactive Proof

\[

\]

## An Interactive Proof

$$
\begin{aligned}
& \text { Y } \\
& \begin{array}{llllllll}
Y_{1} & Y_{2} & Y_{3} & Y_{4} & Y_{5} & \cdots \ldots \ldots \ldots & Y_{100}
\end{array} \\
& 0 \quad 1 \quad 0 \quad 0 \quad 1 \quad \text {................. } 1 \\
& \begin{array}{ll}
\sqrt{Y_{1}} \quad \sqrt{Y_{3}} & \sqrt{Y_{4}} \\
\sqrt{\left(Y_{2} \bullet Y\right)} & \sqrt{\left(Y_{5} \bullet Y\right)}
\end{array} \\
& \sqrt{\left(Y_{100} \bullet Y\right)}
\end{aligned}
$$

## An Interactive Proof

## An Interactive Proof

In order for me to "fool" you, I would have to guess your exact challenge sequence.

## An Interactive Proof

In order for me to "fool" you, I would have to guess your exact challenge sequence.

The probability of my successfully convincing you that $Y$ is a square when it is not is $2^{-100}$.

## An Interactive Proof

In order for me to "fool" you, I would have to guess your exact challenge sequence.

The probability of my successfully convincing you that $Y$ is a square when it is not is $2^{-100}$.

This interactive proof is said to be "zero-knowledge" because the challenger received no information (beyond the proof of the claim) that it couldn't compute itself.

## Applying Fiat-Shamir

Once again, the verifier challenges can be simulated by the use of a one-way function to generate the challenge bits.

## An Non-Interactive ZK Proof

$$
\begin{array}{llllllll}
Y_{1} & Y_{2} & Y_{3} & Y_{4} & Y_{5} & \cdots \cdots \cdots \cdots \cdots & Y_{100}
\end{array}
$$

## An Non-Interactive ZK Proof

\[

\]

## An Non-Interactive ZK Proof

\[

\]

## An Non-Interactive ZK Proof

$$
\begin{aligned}
& \text { Y } \\
& \begin{array}{llllllll}
Y_{1} & Y_{2} & Y_{3} & Y_{4} & Y_{5} & \ldots \ldots \ldots \ldots & Y_{100}
\end{array} \\
& 0 \quad 1 \quad 0 \quad 0 \quad 1 \quad \text {................. } 1 \\
& \begin{array}{ll}
\sqrt{Y_{1}} \quad \sqrt{Y_{3}} & \sqrt{Y_{4}} \\
\sqrt{\left(Y_{2} \bullet Y\right)} & \sqrt{\left(Y_{5} \bullet Y\right)}
\end{array} \\
& \sqrt{\left(Y_{100} \bullet Y\right)}
\end{aligned}
$$

## Proving Knowledge

Suppose that we share a public key consisting of a modulus $N$ and an encryption exponent $E$ and that I want to convince you that I have the corresponding decryption exponent $D$.

How can I do this?

## Proving Knowledge

## Proving Knowledge <br> - I can give you my private key $D$.

## Proving Knowledge

- I can give you my private key $D$.
- You can encrypt something for me and I decrypt it for you.

## Proving Knowledge

- I can give you my private key $D$.
- You can encrypt something for me and I decrypt it for you.
- You can encrypt something for me and I can engage in an interactive proof with you to show that I can decrypt it.

## A Proof of Knowledge

$$
Y
$$

## A Proof of Knowledge

\[

\]

## A Proof of Knowledge

\[

\]

## A Proof of Knowledge

\[

\]

## A Proof of Knowledge

$$
\begin{array}{cccccccc}
Y_{1} & Y_{2} & Y_{3} & Y_{4} & Y_{5} & \cdots \cdots \cdots \cdots \cdots & Y_{100} \\
0 & 1 & 0 & 0 & 1 & \cdots \cdots \cdots \cdots \cdots & 1 \\
Y_{1}{ }^{D} & Y_{3}{ }^{D} & Y_{4}{ }^{D} & & & \\
\left(Y_{2} \bullet Y\right)^{D} & & & \left(Y_{5} \bullet Y\right)^{D} & & & \left(Y_{100} \bullet Y\right)^{D}
\end{array}
$$

## A Proof of Knowledge

By engaging in this proof, the prover has demonstrated its knowledge of $Y^{D}$ - without revealing this value.

If $Y$ is generated by a challenger, this is compelling evidence that the prover possesses $D$.

## Facts About Interactive Proofs

- Anything in PSPACE can be proven with a polynomial-time interactive proof.
- Anything in NP can be proven with a zero-knowledge interactive proof.

## Secret Sharing

## Secret Sharing

Suppose that I have some data that I want to share amongst three people such that

## Secret Sharing

Suppose that I have some data that I want to share amongst three people such that

- any two can uniquely determine the data

## Secret Sharing

Suppose that I have some data that I want to share amongst three people such that

- any two can uniquely determine the data
- but any one alone has no information whatsoever about the data.

## Secret Sharing

Some simple cases: "AND"

I have a secret value $z$ that I would like to share with Alice and Bob such that both Alice and Bob can together determine the secret at any time, but such that neither has any information individually.

## Secret Sharing - AND

Let $z \in \mathbb{Z}_{m}=\{0,1, \ldots, m-1\}$ be a secret value to be shared with Alice and Bob.
Randomly and uniformly select values $x$ and $y$ from $\mathbb{Z}_{m}$ subject to the constraint that

$$
(x+y) \bmod m=z
$$

## Secret Sharing - AND

 The secret value is $z=(x+y) \bmod m$.
## Secret Sharing - AND

 The secret value is $z=(x+y) \bmod m$. Me

## Secret Sharing - AND

 The secret value is $z=(x+y) \bmod m$. Me

## Secret Sharing - AND

## Secret Sharing - AND

## The secret value is $z=(x+y) \bmod m$. Bob

Alice

## Secret Sharing - AND

## The secret value is $z=(x+y) \bmod m$. Bob

Alice

## Secret Sharing - AND

This trick easily generalizes to more than two shareholders.

## Secret Sharing - AND

This trick easily generalizes to more than two shareholders.

A secret $S$ can be written as

$$
S=\left(s_{1}+s_{2}+\cdots+s_{n}\right) \bmod m
$$

for any randomly chosen integer values $s_{1}, s_{2}, \ldots, s_{n}$ in the range $0 \leq s_{i}<m$.

## Secret Sharing

Some simple cases: "OR"

> I have a secret value $z$ that I would like to share with Alice and Bob such that either Alice or Bob can determine the secret at any time.

## Secret Sharing - OR The secret value is $z$.

## Secret Sharing - OR The secret value is $z$.

Me

## Secret Sharing - OR The secret value is $z$.

Me

## Secret Sharing - OR The secret value is $z$.

Me

## Secret Sharing - OR

 The secret value is $z$. Bob

## Secret Sharing - OR The secret value is $z$.

Me

# Secret Sharing - OR The secret value is $z$. 

Alice

## Secret Sharing - OR

## The secret value is $z$. <br> Bob

## Secret Sharing - OR

This case also generalizes easily to more than two shareholders.

## Secret Sharing

More complex access structures ...

I want to share secret value $z$ amongst Alice, Bob, and Carol such that any two of the three can reconstruct $z$.

$$
S=(A \wedge B) \vee(A \wedge C) \vee(B \wedge C)
$$

## Threshold Schemes

## Threshold Schemes

## I want to distribute a secret datum amongst $n$ trustees such that

## Threshold Schemes

I want to distribute a secret datum amongst $n$ trustees such that

- any $k$ of the $n$ trustees can uniquely determine the secret datum,

## Threshold Schemes

I want to distribute a secret datum amongst $n$ trustees such that

- any $k$ of the $n$ trustees can uniquely determine the secret datum,
- but any set of fewer than $k$ trustees has no information whatsoever about the secret datum.

## Threshold Schemes

## OR $\equiv 1$ out of $n$

## AND $n$ out of $n$

## Shamir's Threshold Scheme

Any $k$ points $s_{1}, s_{2}, \ldots, s_{k}$ in a field uniquely determine a polynomial $P$ of degree at most $k-1$ with $P(i)=s_{i}$ for $i=1,2, \ldots, k$.

This not only works of the reals, rationals, and other infinite fields, but also over the finite field

$$
\mathbb{Z}_{p}=\{0,1, \ldots, p-1\}
$$

where $p$ is a prime.

## Shamir's Threshold Scheme

To distribute a secret value $s \in \mathbb{Z}_{p}$ amongst a set of $n$ Trustees $\left\{T_{1}, T_{2}, \ldots, T_{n}\right\}$ such that any $k$ can determine the secret

## Shamir's Threshold Scheme

To distribute a secret value $s \in \mathbb{Z}_{p}$ amongst a set of $n$ Trustees $\left\{T_{1}, T_{2}, \ldots, T_{n}\right\}$ such that any $k$ can determine the secret

- pick random coefficients $a_{1}, a_{2}, \ldots, a_{k-1} \in \mathbb{Z}_{p}$

## Shamir's Threshold Scheme

To distribute a secret value $s \in \mathbb{Z}_{p}$ amongst a set of $n$ Trustees $\left\{T_{1}, T_{2}, \ldots, T_{n}\right\}$ such that any $k$ can determine the secret

- pick random coefficients $a_{1}, a_{2}, \ldots, a_{k-1} \in \mathbb{Z}_{p}$
- let $P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+s$

## Shamir's Threshold Scheme

To distribute a secret value $s \in \mathbb{Z}_{p}$ amongst a set of $n$ Trustees $\left\{T_{1}, T_{2}, \ldots, T_{n}\right\}$ such that any $k$ can determine the secret

- pick random coefficients $a_{1}, a_{2}, \ldots, a_{k-1} \in \mathbb{Z}_{p}$
- let $P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+s$
- give $P(i)$ to trustee $T_{i}$.

## Shamir's Threshold Scheme

To distribute a secret value $s \in \mathbb{Z}_{p}$ amongst a set of $n$ Trustees $\left\{T_{1}, T_{2}, \ldots, T_{n}\right\}$ such that any $k$ can determine the secret

- pick random coefficients $a_{1}, a_{2}, \ldots, a_{k-1} \in \mathbb{Z}_{p}$
- let $P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+s$
- give $P(i)$ to trustee $T_{i}$.

The secret value is $s=P(0)$.

## Shamir's Threshold Scheme

$$

## Shamir's Threshold Scheme

Two methods are commonly used to interpolate a polynomial given a set of points.

## Shamir's Threshold Scheme

Two methods are commonly used to interpolate a polynomial given a set of points.

- Lagrange interpolation

## Shamir's Threshold Scheme

Two methods are commonly used to interpolate a polynomial given a set of points.

- Lagrange interpolation
- Solving a system of linear equations

## Lagrange Interpolation

## Lagrange Interpolation

For each point $\left(i, s_{i}\right)$, construct a polynomial $P_{i}$ with the correct value at $i$ and a value of zero at the other given points.

## Lagrange Interpolation

For each point $\left(i, s_{i}\right)$, construct a polynomial $P_{i}$ with the correct value at $i$ and a value of zero at the other given points.

$$
P_{i}(x)=s_{i} \times \prod_{j \neq i}(x-j) \div \prod_{j \neq i}(i-j)
$$

## Lagrange Interpolation

For each point $\left(i, s_{i}\right)$, construct a polynomial $P_{i}$ with the correct value at $i$ and a value of zero at the other given points.

$$
P_{i}(x)=s_{i} \times \prod_{j \neq i}(x-j) \div \prod_{j \neq i}(i-j)
$$

Then sum the $P_{i}(x)$ to compute $P(x)$.

## Lagrange Interpolation

For each point $\left(i, s_{i}\right)$, construct a polynomial $P_{i}$ with the correct value at $i$ and a value of zero at the other given points.

$$
P_{i}(x)=s_{i} \times \prod_{j \neq i}(x-j) \div \prod_{j \neq i}(i-j)
$$

Then sum the $P_{i}(x)$ to compute $P(x)$.

$$
P(x)=\sum_{i} P_{i}(x)
$$

## Solving a Linear System

## Solving a Linear System

- Regard the polynomial coefficients as unknowns.

## Solving a Linear System

- Regard the polynomial coefficients as unknowns.
- Plug in each known point to get a linear equation in terms of the unknown coefficients.

## Solving a Linear System

- Regard the polynomial coefficients as unknowns.
- Plug in each known point to get a linear equation in terms of the unknown coefficients.
- Once there are as many equations as unknowns, use linear algebra to solve the system of equations.

## Verifiable Secret Sharing

Secret sharing is very useful when the "dealer" of a secret is honest, but what bad things can happen if the dealer is potentially dishonest?

Can measures be taken to eliminate or mitigate the damages?

## Homomorphic Encryption

Recall that with RSA, there is a multiplicative homomorphism.

$$
E(x) E(y) \equiv E(x y)
$$

Can we find an encryption function with an additive homomorphism?

## An Additive Homomorphism

Can we find an encryption function for which the sum (or product) of two encrypted messages is the (an) encryption of the sum of the two original messages?

$$
E(x) \circ E(y) \equiv E(x+y)
$$

## An Additive Homomorphism

Recall the one-way function given by

$$
f(x)=g^{x} \bmod m
$$

For this function,

$$
\begin{gathered}
f(x) f(y) \bmod m=g^{x} g^{y} \bmod m= \\
g^{x+y} \bmod m=f(x+y) \bmod m
\end{gathered}
$$

## Verifiable Secret Sharing

## Verifiable Secret Sharing

- Select a polynomial with secret $a_{0}$ as

$$
P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+a_{0}
$$

## Verifiable Secret Sharing

- Select a polynomial with secret $a_{0}$ as

$$
P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+a_{0} .
$$

- Commit to the coefficients by publishing

$$
g^{a_{0}}, g^{a_{1}}, g^{a_{2}}, \ldots, g^{a_{k-1}} .
$$

## Verifiable Secret Sharing

- Select a polynomial with secret $a_{0}$ as

$$
P(x)=a_{k-1} x^{k-1}+\cdots+a_{2} x^{2}+a_{1} x+a_{0} .
$$

- Commit to the coefficients by publishing

$$
g^{a_{0}}, g^{a_{1}}, g^{a_{2}}, \ldots, g^{a_{k-1}}
$$

- Compute a commitment to $P(i)$ from public values as

$$
g^{P(i)}=g^{a_{0} i^{0}} g^{a_{1} i^{1}} g^{a_{2} i^{2}} \cdots g^{a_{k-1} i^{k-1}} .
$$

## Verifiable Secret Sharing

An important detail

Randomness must be included to prevent small spaces of possible secrets and shares from being exhaustively searched.

## Secret Sharing Homomorphisms

All of these secret sharing methods have an additional useful feature:

If two secrets are separately shared amongst the same set of people in the same way, then the sum of the individual shares constitute shares of the sum of the secrets.

## Secret Sharing Homomorphisms

## OR

Secret: $a$ - Shares: $a, a, \ldots, a$
Secret: $b$ - Shares: $b, b, \ldots, b$

Secret sum: $a+b$
Share sums: $a+b, a+b, \ldots, a+b$

## Secret Sharing Homomorphisms

## AND

Secret: $a$ - Shares: $a_{1}, a_{2}, \ldots, a_{n}$
Secret: $b$ - Shares: $b_{1}, b_{2}, \ldots, b_{n}$

Secret sum: $a+b$
Share sums: $a_{1}+b_{1}, a_{2}+b_{2}, \ldots, a_{n}+b n$

## Secret Sharing Homomorphisms

## THRESHOLD

Secret: $P_{1}(0)-$ Shares: $P_{1}(1), P_{1}(2), \ldots, P_{1}(n)$
Secret: $P_{2}(0)$ - Shares: $P_{2}(1), P_{2}(2), \ldots, P_{2}(n)$

Secret sum: $P_{1}(0)+P_{2}(0)$
Share sums: $P_{1}(1)+P_{2}(1), P_{1}(2)+P_{2}(2), \ldots, P_{1}(n)+P_{2}(n)$

## Threshold Encryption

I want to encrypt a secret message $M$ for a set of $n$ recipients such that

- any $k$ of the $n$ recipients can uniquely decrypt the secret message $M$,
- but any set of fewer than $k$ recipients has no information whatsoever about the secret message $M$.

## Recall Diffie-Hellman

## Alice

- Randomly select a large integer $a$ and send $A=g^{a} \bmod p$.
- Compute the key
$K=B^{a} \bmod p$.

## Bob

- Randomly select a large integer $b$ and send $B=g^{b} \bmod p$.
- Compute the key
$K=A^{b} \bmod p$.

$$
B^{a}=g^{b a}=g^{a b}=A^{b}
$$

## ElGamal Encryption

## ElGamal Encryption

- Alice selects a large random private key $a$ and computes an associated public key $\quad A=g^{a} \bmod p$.

## ElGamal Encryption

- Alice selects a large random private key $a$ and computes an associated public key $\quad A=g^{a} \bmod p$.
- To send a message $M$ to Alice, Bob selects a random value $r$ and computes the pair

$$
(X, Y)=\left(A^{r} M \bmod p, g^{r} \bmod p\right)
$$

## ElGamal Encryption

- Alice selects a large random private key $a$ and computes an associated public key $A=g^{a} \bmod p$.
- To send a message $M$ to Alice, Bob selects a random value $r$ and computes the pair

$$
(X, Y)=\left(A^{r} M \bmod p, g^{r} \bmod p\right) .
$$

- To decrypt, Alice computes

$$
X / Y^{a} \bmod p=A^{r} M / g^{r a} \bmod p=M .
$$

## ElGamal Re-Encryption

If $A=g^{a} \bmod p$ is a public key and the pair

$$
(X, Y)=\left(A^{r} M \bmod p, g^{r} \bmod p\right)
$$

is an encryption of message $M$, then for any value $c$, the pair

$$
\left(A^{c} X, g^{c} Y\right)=\left(A^{c+r} M \bmod p, g^{c+r} \bmod p\right)
$$

is an encryption of the same message $M$, for any value $c$.

## Group ElGamal Encryption

## Group ElGamal Encryption

- Each recipient selects a large random private key $a_{i}$ and computes an associated public key $A_{i}=g^{a_{i}} \bmod p$.

## Group ElGamal Encryption

- Each recipient selects a large random private key $a_{i}$ and computes an associated public key $A_{i}=g^{a_{i}} \bmod p$.
- The group key is $A=\Pi A_{i} \bmod p=g^{\sum a_{i}} \bmod p$.

## Group ElGamal Encryption

- Each recipient selects a large random private key $a_{i}$ and computes an associated public key $A_{i}=g^{a_{i}} \bmod p$.
- The group key is $A=\Pi A_{i} \bmod p=g^{\sum a_{i}} \bmod p$.
- To send a message $M$ to the group, Bob selects a random value $r$ and computes the pair $(X, Y)=\left(A^{r} M \bmod p, g^{r} \bmod p\right)$.

## Group ElGamal Encryption

- Each recipient selects a large random private key $a_{i}$ and computes an associated public key $A_{i}=g^{a_{i}} \bmod p$.
- The group key is $A=\Pi A_{i} \bmod p=g^{\sum a_{i}} \bmod p$.
- To send a message $M$ to the group, Bob selects a random value $r$ and computes the pair $(X, Y)=\left(A^{r} M \bmod p, g^{r} \bmod p\right)$.
- To decrypt, each group member computes $Y_{i}=Y^{a_{i}} \bmod p$. The message $M=X / \Pi Y_{i} \bmod p$.

## Threshold Encryption (ElGamal)

## Threshold Encryption (ElGamal)

- Each recipient selects $k$ large random secret coefficients $a_{i, 0}, a_{i, 1}, \ldots, a_{i, k-2}, a_{i, k-1}$ and forms the polynomial $P_{i}(x)=a_{i, k-1} x^{k-1}+a_{i, k-2} x^{k-2}+\cdots+a_{i, 1} x+a_{i, 0}$

## Threshold Encryption (ElGamal)

- Each recipient selects $k$ large random secret coefficients $a_{i, 0}, a_{i, 1}, \ldots, a_{i, k-2}, a_{i, k-1}$ and forms the polynomial

$$
P_{i}(x)=a_{i, k-1} x^{k-1}+a_{i, k-2} x^{k-2}+\cdots+a_{i, 1} x+a_{i, 0}
$$

- Each polynomial $P_{i}(x)$ is then verifiably shared with the other recipients by distributing each $g^{a_{i, j}}$.

## Threshold Encryption (ElGamal)

- Each recipient selects $k$ large random secret coefficients $a_{i, 0}, a_{i, 1}, \ldots, a_{i, k-2}, a_{i, k-1}$ and forms the polynomial

$$
P_{i}(x)=a_{i, k-1} x^{k-1}+a_{i, k-2} x^{k-2}+\cdots+a_{i, 1} x+a_{i, 0}
$$

- Each polynomial $P_{i}(x)$ is then verifiably shared with the other recipients by distributing each $g^{a_{i, j}}$.
- The joint (threshold) public key is $\prod g^{a_{i, 0}}$.

## Threshold Encryption (ElGamal)

- Each recipient selects $k$ large random secret coefficients $a_{i, 0}, a_{i, 1}, \ldots, a_{i, k-2}, a_{i, k-1}$ and forms the polynomial

$$
P_{i}(x)=a_{i, k-1} x^{k-1}+a_{i, k-2} x^{k-2}+\cdots+a_{i, 1} x+a_{i, 0}
$$

- Each polynomial $P_{i}(x)$ is then verifiably shared with the other recipients by distributing each $g^{a_{i, j}}$.
- The joint (threshold) public key is $\prod g^{a_{i, 0}}$.
- Any set of $k$ recipients can form the secret key $\sum a_{i, 0}$ to decrypt.
