## Computing a tree: I

Genome 559: Introduction to Statistical and Computational Genomics

Prof. James H. Thomas

## Defining what a tree means

rooted tree (all real trees are rooted):
unrooted tree (used when the root isn't known):

...divergence time is the sum of (horizontal) branch lengths

# Parsimony principle 

## Find the tree that requires the fewest changes

## Consider 4 sequences - all possible unrooted trees

## Consider 4 sequences - all possible unrooted trees

## Consider site 1

## Consider site 1

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| human |  |  |  |  |  |  |
| chimp |  |  |  |  |  |  |
| gorilla |  |  |  |  |  |  |
| orangutan | $a$ | $g$ | $t$ | $c$ | $t$ | $c$ |
| $a$ | $g$ | $a$ | $g$ | $t$ | $c$ |  |
| $c$ | $g$ | $g$ | $c$ | $a$ | $g$ |  |
| $c$ | $g$ | $g$ | $g$ | $a$ | $c$ |  |

## Consider site 1

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| human | $a$ | $g$ | $t$ | $c$ | $t$ | $c$ |
| chimp |  |  |  |  |  |  |
| gorilla |  |  |  |  |  |  |
| orangutan | $a$ | $g$ | $a$ | $g$ | $t$ | $c$ |
|  | $c$ | $g$ | $g$ | $c$ | $a$ | $g$ |
| $c$ | $g$ | $g$ | $g$ | $a$ | $c$ |  |

## Consider site 1

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| human |  |  |  |  |  |  |
| chimp |  |  |  |  |  |  |
| gorilla |  |  |  |  |  |  |
| orangutan | $a$ | $g$ | $t$ | $c$ | $t$ | $c$ |
| $a$ | $g$ | $a$ | $g$ | $t$ | $c$ |  |
| $c$ | $g$ | $g$ | $c$ | $a$ | $g$ |  |
| $c$ | $g$ | $g$ | $g$ | $a$ | $c$ |  |

## Consider site 2

## Consider site 3

## Put sites 1 and 3 together

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| human |  |  |  |  |  |  |
| chimp |  |  |  |  |  |  |
| gorilla |  |  |  |  |  |  |
| orangutan | $a$ | $g$ | $t$ | $c$ | $t$ | $c$ |
| $a$ | $g$ | $a$ | $g$ | $t$ | $c$ |  |
| $c$ | $g$ | $g$ | $c$ | $a$ | $g$ |  |
| $c$ | $g$ | $g$ | $g$ | $a$ | $c$ |  |

## Now put all of them together

|  | 1 | 2 | 3 |  | 4 | 5 |  | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| human | a | $g$ | t |  | C | t |  | C |
| chimp | a | $g$ | a |  | $g$ | t |  | C |
| gorilla | C | $g$ | $g$ |  | c | a |  | $g$ |
| orangutan | C | $g$ | g |  | - |  |  |  |

Which tree is most parsimonious?

|  | 1 | 2 | 3 |  |  | 5 |  | 6 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| human | a | g | t |  | c | t |  | c |
| chimp | a | $g$ | a |  | g | t |  | C |
| gorilla | C | g | $g$ |  | c | a |  | $g$ |
| orangutan | C | $g$ | g |  | - | a |  |  |

## Parsimony algorithm

1) Construct all possible trees
2) For each informative site in alignment count changes on each tree
3) Add them all up for each tree
4) Pick the lowest scoring

## Distance trees

- Measure pairwise distance between each pair of sequences.
- Use a clustering method to build up a tree, starting with the closest pair (next lecture).

|  | 1 | 2 | 3 | 4 | 5 | 6 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| human | $a$ | $g$ | $t$ | $c$ | $t$ | $c$ |
| chimp | $a$ | $g$ | $a$ | $g$ | $t$ | $c$ |
| gorilla | $c$ | $g$ | $g$ | $c$ | $a$ | $g$ |
| orangutan | $c$ | $g$ | $g$ | $g$ | $a$ | $c$ |

human - chimp has 2 changes out of 6 sites $\square$ human - orang has 4 changes of out 6 sites etc.
