## CSE 461: Bridging LANs

## Last Topic ...

- Medium Access Control (MAC) protocols
- Part of the Link Layer
- At the heart of Local Area Networks (LANs)
- How do multiple parties share a wire or the air?
- Random access protocols (CSMA/CD)
- Contention-free protocols (turn-taking, reservations)
- Wireless protocols (CSMA/CA and RTS/CTS)

## This Time -- Switching (a.k.a. Bridging)

- Focus:
- What to do when one shared LAN isn't big enough?
- Interconnecting LANs
- Bridges and LAN switches
- A preview of the Network layer

Application
Presentation
Session
Transport Network
Data Link
Physical

## Limits of a LAN

- One shared LAN can limit us in terms of:
- Distance
- Number of nodes
- Performance

- How do we scale to a larger, faster network?
- We must be able to interconnect LANs

## Switching (a.k.a. Bridging)

- Transferring a packet from one LAN to another LAN - Build an "extended LAN"
- Different varieties of switching
- Packet switched vs. circuit switched
- Connection vs. Connectionless
- We'll focus on connectionless, packet switched
- Ethernet

## Bridges and Extended LANs

- "Transparently" interconnect LANs with bridge
- Receive frames from each LAN and forward to the other
- Each LAN is its own collision domain; bridge isn't a repeater
- Could have many ports

## Learning Bridges

- To optimize overall performance:
- Shouldn't forward $A \rightarrow B$ or $C \rightarrow D$, should forward $A \rightarrow C$ and D $\rightarrow$ B

- How does the bridge know?
- Learn who is where by observing source addresses and prune
- Forward using destination address; age for robustness

## Why stop at one bridge?

- Allows you to incrementally build out network, across organizations
- What problems could arise?
- How to solve them?

## Announcements

- Midterm on Feb $16^{\text {th }}$ in class (more details later)
- Djikstra's code was circulated by Safeer - feel free to use it
- Any volunteers who are willing to share the project 1 code with the entire class?

## Spanning Tree Example

- Spanning tree uses select bridge ports so there are no cycles
- Prune some ports
- Only one tree
- Q: How do we find a spanning tree?
- Automatically with a distributed algorithm

## Spanning Tree

- Compute ST with a bridge as root such that
- Root forwards onto all of its outgoing ports
- Other bridges forward TO the root if a packet is coming from a bridge further from the root, else they forward away from the root
- Packet traversal: forwards (UP)* then (DOWN*)

(a)

(b)

## Spanning tree vs. learning

- Once the spanning tree is in place...
- the bridge uses the regular learning algorithm to figure out which ports to forward / flood packet on
- Job of spanning tree algorithm is to disable some ports to eliminate cycles

## Spanning Tree Algorithm

- Distributed algorithm to compute spanning tree
- Robust against failures, needs no organization
- Developed by Radia Perlman at DEC
- IEEE 802.1 spec
- http://www1.cs.columbia.edu/~ji/F02/ir02/p44perlman.pdf
- Outline: Goal is to turn some bridge ports off

1. Elect a root node of the tree (lowest address)
2. Grow tree as shortest distances from the root (using lowest address to break distance ties)

- All done by bridges sending periodic configuration messages over ports for which they are the "best" path
- Then turn off ports that aren't on "best" paths

## Algorithm Overview

- Each bridge has a unique id
- e.g., B1, B2, B3
- Select the bridge with the smallest id as root
- Select bridge on each LAN that is closest to the root as that LAN's designated bridge
- use ids to break ties

- Each bridge forwards frames over each LAN on which it is the designated bridge

## Algorithm continued

- Bridges exchange configuration messages, containing:
- id for bridge sending the message
- id for what the sending bridge believes to be the root bridge
- distance (hops) from sending bridge to root bridge
- Each bridge records current best configuration message for each port

## Algorithm continued

- Initially, each bridge believes it is the root
- when learn not root, stop generating configuration messages
- instead, forward root's configuration message - incrementing distance field by 1
- in steady state, only root generates configuration messages

## Algorithm More...

- When learn not designated bridge on LAN, stop forwarding configuration messages
- in steady state, only designated bridges forward configuration messages
- Root bridge continues to send configuration messages periodically
- If a bridge does not receive config. message after a period of time:
- assumes topology has changed
- starts generating configuration messages claiming to be root

## Algorithm Example

Message format: (root, dist-to-root, sending bridge)
Sample messages sequences to and from B3:

1. $B 3$ sends $(B 3,0, B 3)$ to $B 2$ and $B 5$
2. $B 3$ receives ( $B 2,0, B 2$ ) and ( $B 5,0$, B5) and accepts B2 as root
3. $B 3$ sends $(B 2,1, B 3)$ to $B 5$
4. $B 3$ receives ( $B 1,1, B 2$ ) and ( $B 1,1$, $B 5$ ) and accepts B1 as root
5. B3 could send ( $B 1,2, B 3$ ) but doesn't as its nowhere "best"

B 2 and B5 are better choices. so B3 is NOT a designated bridge
6. B3 receives ( $B 1,1, B 2$ ) and (B1, 1,
 B5) again ... stable
B3 turns off data forwarding to LANs A and C

## Some other tricky details

- Configuration information is aged
- If the root fails a new one will be elected
- Reconfiguration is damped
- Adopt new spanning trees slowly to avoid temporary loops

## LAN Switches

- LAN switches are multi-port bridges
- Modern, high performance form of bridged LANs
- Looks like a hub, but frames are switched, not shared
- Every host on a separate port, or can combine switches

## Limitations of Bridges/Switches

- LAN switches form an effective small-scale network
- Plug and play for real!
- Why can't we build a large network using bridges?
- Little control over forwarding paths
- Size of bridge forwarding tables grows with number of hosts
- Broadcast traffic flows freely over whole extended LAN
- Spanning tree algorithm limits reconfiguration speed

## Key Concepts

- We can overcome LAN limits by interconnection
- Bridges and LAN switches
- But there are limits to this strategy ...
- Next Topic: Routing and the Network layer
- How to grow large and really large networks
